CONFERENCE TITLE

III. International Architectural Sciences and Applications Symposium,
(IArcSAS-2023)

DATE and PLACE

September 14-15, 2023
The University of Naples Federico II, the Engineering Building at Piazzale Tecchio,
80 - 80100 Naples. Italy.

ORGANIZING

The Editorial Board of the Journal of Architectural Sciences and Applications, Isparta, Türkiye.
(<https://dergipark.org.tr/en/pub/mbud>)

Institute of Economic Development and Social Research,
Adıyaman, Türkiye.
(<https://www.iksadinstitute.org/>)

The University of Naples Federico II. Naples, Italy. (Hosting)
(<https://www.international.unina.it>)

Laboratory of Territory, Mobility and Environment (TeMA Lab) (Hosting)
(http://www.tema_lab.unina.it/lab/)

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

AIMS OF THE SYMPOSIUM

This Symposium aims to bring together qualified scientists from Türkiye and abroad on a common international platform under the umbrella of “Architectural Sciences” and to enable “different disciplines” to share their valuable research.

TOPICS OF THE SYMPOSIUM

- Planning (Planning theories, planning paradigms, types of planning, regional planning, watershed planning, landscape planning, urban planning, rural planning, planning and protection, spatial and temporal changes, site selection methods, etc.),
- Design (Design Theories, Space, Building, Urban, Landscape, Rural, Village, Tourism, Recreational, Environment, Interior Architecture, Plantation, Industrial Products, Ecological, Universal, Disabled, etc.),
- Sociology / Psychology / Art / Philosophy / History / Identity / Theory / Aesthetics,
- Protected Areas / Natural and Cultural Heritage Protection / Documentation / Renovation / Repair / Restoration / Soil sealing,
- Tourism / Recreation / Cultural Tourism / Nature Tourism / Ecotourism / Archeology,
- Climate Change / Renewable Energy / Energy saving / Energy Transition / Water / Sustainability / Ecology/ Environment / Sustainable Development,
- Smart and Ecological Cities / Urbanizm / Landscape / Open and Green Spaces / Green infrastructure / Transportation / Urban Agriculture / Urban Renewal / Transformation,
- Building Materials / Green Buildings / Urban Accessories and Furniture / Landscape materials/ Landscape Plant Materials and Using/ Plant Cultivation and Use,
- Technology / Artificial Intelligence / Digital Architecture and 3D Software and Printer, GIS, Remote sensing,
- Health / Pandemic / Food / Occupational Health and Safety,
- Higher Education in Architectural Sciences / R&D / Scientific Researches / Publications,
- Future of Architectural Sciences / Utopia / Space Architecture / Water Architecture,
- Economic / Policies / Legislation / Management / Governance / Practices / Sectoral Problems,
- Planning and Design Project Competitions and Processes /Applied Project, etc.

PRESENTATION

Oral and Online Presentations

EVALUATION PROCESS and POLICIES

All applications have undergone double blind peer review process. In addition, each paper was accepted and the process of publishing in the book was carried out through editorial oversight. The published papers were presented and discussed at the meeting.

Full texts and abstracts published in accordance with the Symposium Policy have been prepared in accordance with ethical rules and APA standards. Authors of all papers are both ethically and legally responsible.

PARTICIPANTS COUNTRIES

Türkiye, Turkish Republic of Northern Cyprus, Italy, Algeria, Brazil, Bulgaria, China, Ethiopia, Bangladesh, France, Greece, Georgia, Germany, Hungary, India, Iran, Kosovo, Macedonia, Malaysia, Morocco, Nigeria, Pakistan, Philippines, Poland, Romania, Russia, Spain, Ukraine, United Arab Emirates, United Kingdom, Vietnam.

TOTAL ACCEPTED ARTICLES: 364

Number of Rejected Papers: 35

The Number of Accepted Papers from Türkiye: 171

The Number of Accepted Full Papers from Other Countries: 187

The Number of Total Papers:358

SYMPOSIUM SCHEDULE

14.09.2023		10:00-11:30	Opening Speeches					
	SESSION 1 (Invited Speakers)	11:30-12:45	HALL-1					
		Moderator	Elif Demirel					
	SESSION 2 (Face to Face)	13:00-15:00	P.le Tecchio 80 (Napoli)					
		Moderator	Sebahat Sevde Sağlam					
	SESSION 3	13:00-15:00	HALL-1	HALL-2	HALL-3	HALL-4	HALL-5	HALL-6
		Moderators	Carmen Guida	Hayriye Hale Kozlu	Sevgi Yılmaz	Serkan Sipahi	Mert Çakır	Hani Benguesmia
	SESSION 4	15:15-17:15	HALL-1	HALL-2	HALL-3	HALL-4	HALL-5	HALL-6
		Moderators	Mehmet Tuncer	Gerardo Carpentieri	Hasan Yılmaz	İsmail Emre Kavut	Nodar Sulashvili	Vaibhav Kant Singh
	SESSION 5	17:30-19:30	HALL-1	HALL-2	HALL-3	HALL-4	HALL-5	HALL-6
	Moderators	Niyazi Uğur Koçkal	Ümit Turgay Arpacıoğlu	Mert Çakır	Floriana Zucaro	Halime Gözlükaya	Gizem Dinç	
15.09.2023	SESSION 6	8:30-10:30	HALL-1	HALL-2	HALL-3	HALL-4	HALL-5	HALL-6
		Moderators	H. Berk Türker	Bahia Messai	Tuba Gizem Aydoğan	Ahmet Erkan Metin	Mert Akoğlu	Orhan Alav
	SESSION 7	10:45-12:45	HALL-1	HALL-2	HALL-3	HALL-4	HALL-5	HALL-6
		Moderators	Aybike Ayfer Karadağ	Lale Karataş	Asena Soyuluk	H. Berk Türker	Bogdan-Catalin Serban	Vaibhav Kant Singh
	SESSION 8	13:00-15:00	HALL-1	HALL-2	HALL-3	HALL-4	HALL-5	HALL-6
		Moderators	Kağan Günce	Tendü Hilal Göktuğ	Şirin Gülcen Eren	Şevket Alp	Doğa Demirel	Nodar Sulashvili
	SESSION 9	15:15-17:15	HALL-1	HALL-2	HALL-3	HALL-4	HALL-5	
		Moderators	Şebnem Ertaş Beşir	Meryem Bihter Bingül Bulut	Ebru Doğan	Murat AKTEN	Bogdan-Catalin Serban	
	SESSION 10	17:30-19:30	HALL-1	HALL-2	HALL-3	HALL-4	HALL-5	
		Moderators	Salih Ofloğlu	Demet Demiroğlu	Cengiz Yücedağ	Ertan Düzgüneş	Çağla Aydemir

Visual Comfort And Illumination Within Mosques

- Sacred architectural environments wield the potency to evoke profound emotional and physiological responses in individuals, allowing for the orchestrated interplay of symbolic and material constituents in spatial configuration. These edifices primarily facilitate worship and spiritual practices among adherents united by shared convictions and sentiments.

Figure 8: Visual Comfort and Illumination Within Mosques

- In this context, the seamless alignment of the philosophical underpinnings of faith with the tangible architectural parameters is paramount, as it engenders a cohesive conduit for the nuanced transmission of abstract tenets into illustrative form. Illustratively, the diffusion of natural light through fenestral apertures encircling the dome within mosques is not only a functional requisite to furnish requisite luminosity to enable visual discernment, but also exerts a congregative influence, coaxing individuals to converge beneath the dome while augmenting the perceptual richness of the space. This intrinsic harmony between the enduring cultural ethos and the intricacies of illumination design

ROUTES AND TRACES: THE ROLE OF CONSTRUCTION MATERIALS IN SHAPING THE PEDESTRIAN-FRIENDLY URBAN ENVIRONMENT

Discussions of Building
 Çarşın Mosque located between Bey and Sütlüce neighborhoods of Üsküdar, the southern part of Istanbul, was built in 1716. It is an impressive historical building with a lot of unique features which consists of non-conventional roof and facade. There are deep under ground passages on the ground floor of Çarşın Mosque. It is a traditional and unique in the context of the Mosque. There are non-orthogonal, square arches, which are the main feature in the facade. The entrance of the mosque is oriented towards a small square door. It is a decorative feature providing entrance. With its singular pediment and profile facade makes the building a characteristic architectural setting.

Sustainable construction

- It means building with renewable and recyclable resources and materials.
- During construction projects, care must be taken to reduce waste and energy consumption where possible and protect the natural environment around the site.

Introduction:

- Süls bitkileri farklı yöntemler kullanılarak estetik, fonksiyonel ve ekolojik amaçlarla terimim, çoğaltım ve büyütilim bitkiler olarak tanımlanabilir.
- Bu tanımdan anlaşılacağı üzere süls bitkileri kapama ve terimim yapması çok geniş bir alandır. Bu şekilde tanımlı ve ekolojik gelişiminde hızlı gelişen, her yıl iki kez hasatı mümkün olan bitkilere de dahildir.
- Ayrıca üreticiler için ve terimim faaliyetleri bakımından önemli ekolojik ve doğal yararları, uygun iklim ve coğrafi koşulları, pazar likiditesi yüksekliği ve ucuz işleme kapasitesi gibi önemli avantajlara sahiptir.
- Ornamental plants can be defined as plants that are produced, propagated and grown for aesthetic, functional and economic purposes using different methods. As can be understood from this definition, ornamental plants are a sector with a very wide scope and production range. This sector extends its growth made volume every year depending on agricultural and sectoral developments.
- In addition, in terms of cultivation and production activities, our country has important advantages such as its ecology and natural assets, suitable climatic and geographical conditions, proximity to market countries and cheap labor force.

Phase 3: 3D Coordination and Project Management
(MKE542 and ISM17084 courses)

- Developing MEP (Mechanical Electrical Plumbing) models for assets with external support from the industry
- Construction management by engineering students: 3D coordination, 4D/5D modeling in BIM software
- Placing final models to the Published area of the CDE.

Software: Autodesk Revit, Autodesk Navisworks

1. Introduce

- Dünya var olduğundan bugüne kadar deprem, sel, erozyon, toprak kayması, kasırga gibi doğal süreçler her zaman gerçekleşmiş ve gerçekleşecektir. İnsanın çok yönlü faaliyetlerinin doğal süreçlerle uyumlu olmaması, zarar verici yaklaşımlarının olması ve gerekli tedbirleri alınmaması gibi nedenlerle söz konusu doğal süreçler can ve mal kaybına yol açarak doğal afetlere dönüşmektedir.
- Natural processes such as earthquakes, floods, erosion, landslides and hurricanes have always occurred and will always occur
- These natural processes turn into natural disasters by causing loss of life and property due to reasons such as the incompatibility of human versatile activities with natural processes, having damaging approaches and not taking necessary measures.

Sonuçta Doğal afetler insan kaynaklı bir sonuçtur. As a result, natural disasters are 8. doğal human-induced result.

Kilise Sahneleri

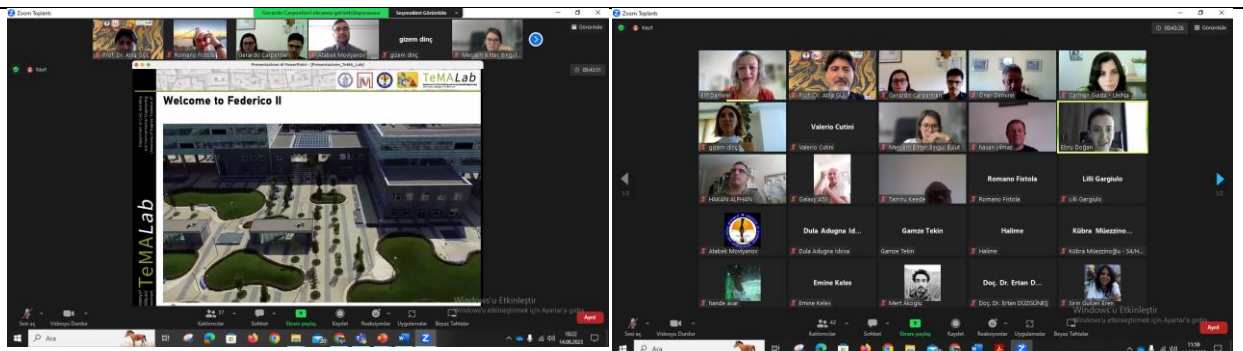

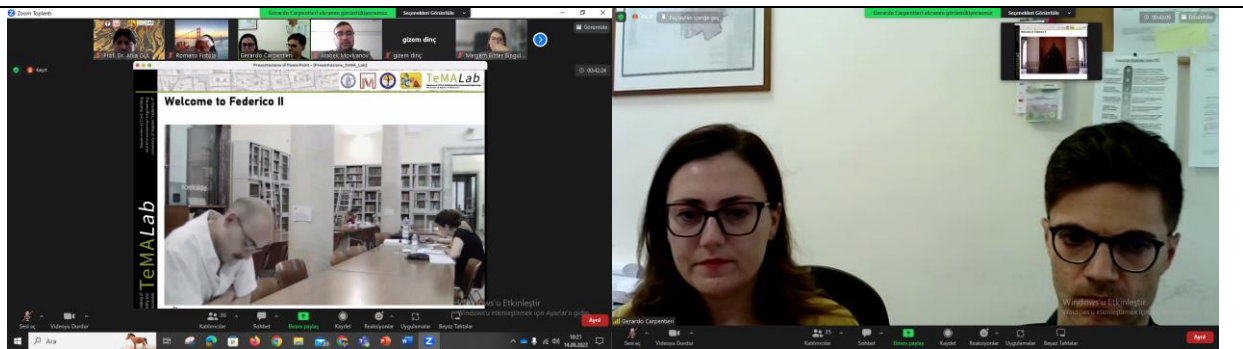

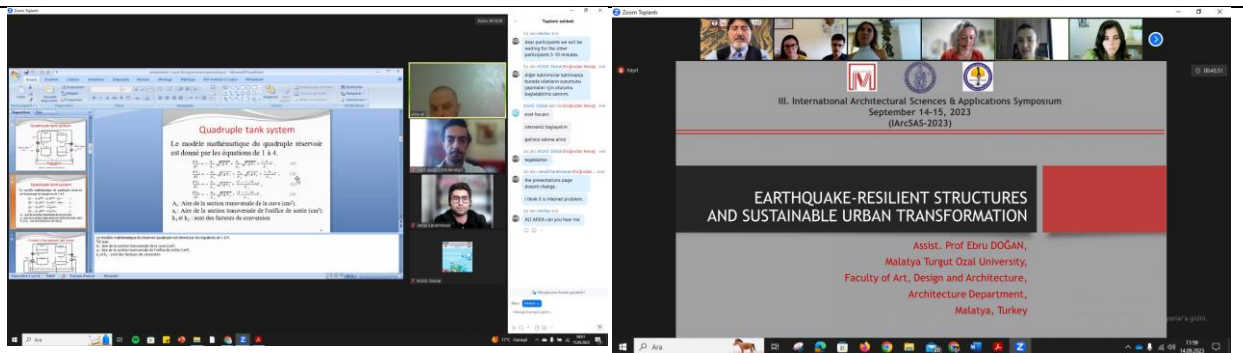

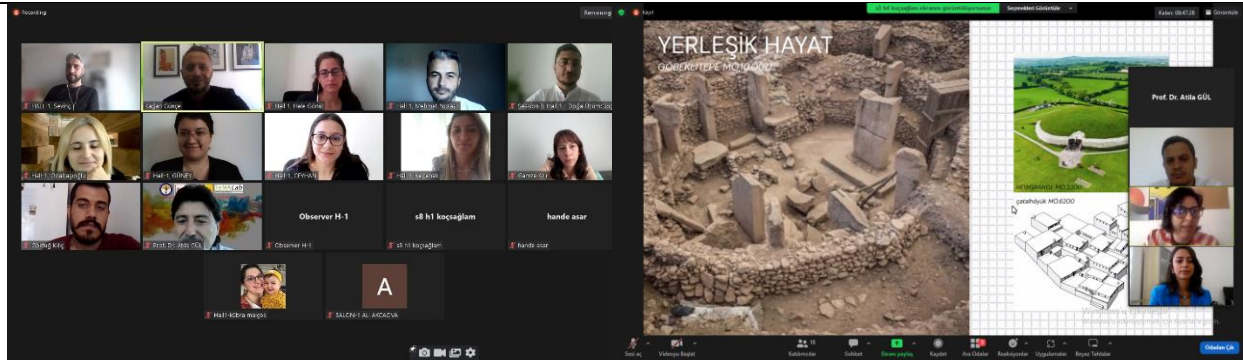

Bu sahneler bir "işimcilik" ortamında önemli bir rol oynayabilir. Bu sahneler diğer kişilerle insanları bilgilendirir ve etkiler. "Hatalarımız" olarak da bilinen, hatalarımız günlük hayatımızda ve her günümüzde yerleşik yapılarımızda olabilir.

ABSTRACT

In the face of unprecedented and potentially extreme climate change, urban open spaces may not have the same capacity to adapt. In this context, planned adjustments to “business as usual” are becoming relevant to lead to effective adaptation measures, explicitly influencing urban adaptation planning and interventions. In fact, urban open spaces represent a flexible infrastructure including different urban spaces (i.e., squares, green urban areas, gardens, paved areas), vital to urban resilience and quality of life. In this perspective, this paper is oriented toward answering the following research question: how to transform the open space system to adapt it to climate change and increase urban resilience? For this purpose, we provide a method to support local decision-makers in the definition of appropriate and efficient adaptation, reorganization, and reuse interventions, according to their physical and urban context characteristics, as well as the needed costs and the likely positive effects.

ABSTRACT

Shapes, designs, and styles are continuously changing and fashion is constantly evolving. Yet the term sustainability, is not as common in the global fashion industry as it is in other manufacturing industries. Sustainability in the textile and clothing sectors impacted by several stages such as raw material, manufacturing process, supplychain and product lifecycle. Many international fashion brands and designers use innovative sustainable fabrics to differentiate their brands and appeal to consumers which are manufactured with the innovative sustainable alternative fibers in respect to the conventional fibres. These innovative sustainable fibres can be organic, biodegradable, recyclable, eco-friendly, highly functional with the extent of product life span. In compare to conventional cotton, organic cotton uses 62% less energy and 88% less water overall and is grown without the use of pesticides or synthetic fertilisers. Cork fabric has gradually found its way in the fashion industry instead of stopper for wine bottles. Since hemp absorbs more carbon dioxide from the atmosphere than the average plant, it is regarded as a raw material with negative carbon emissions. TENCEL, Lenzing's trademark lyocell is made with a closed-loop system that recycles 99.5% of the solvents used during production. Apple leather, also known as Frumat or Pellemela, is made from waste materials from the apple juice industry. Qmilk is a milk protein and casein fibre by-product of the dairy industry. The ethical shoe company Po-Zu, based in London, makes its products by hand sewing organic cotton and Pinatex (leather made from pineapple leaf fibres) together without the use of glue. To address these issues, numerous Indian brands and designers have adopted sustainable practises in recent years. The sustainable fashion market in India is expected to grow at a CAGR of 10.6% during 2021-2026, according to a report by researchandmarkets.com. The report also suggests that the market's growth will be driven by increased consumer awareness, government initiatives, and the availability of sustainable materials.

ABSTRACT

Context awareness is an important input that should be considered as a priority for any design to be developed. In this study, it is aimed to evaluate the contributions and potentials of extended reality in establishing a relationship with place and space in relation to the field of architectural design. Within the scope of the study, case studies revealed with extended reality were examined. Under the two different scales of place and space, context awareness in terms of the relationship of the building to the place in which it will be located in the future and the interior design of existing spaces are discussed. Being in direct contact with physical reality through extended reality allows architects to go beyond designing with certain data that is reduced after observing a place or existing space. It can be seen that the case studies examined help users to understand the existing data better and identify the problems. As a result, users can develop their architectural designs in situ with the context awareness of the place or space. Considering the rapid development and dissemination of extended reality, it is thought that the in situ design approach will be accepted by architects in future design actions.

ABSTRACT

Changing production and consumption patterns due to rapid population growth, industrialization and globalization cause urbanization to increase rapidly. This situation affects not only big cities but also small settlements that have gained urban identity as a result of various functions. That process can be observed more concretely in rural settlements located on the coastline, which has historical urban landscape characteristics that define the identity of the city. Today, social and cultural developments that occur under the influence of globalization create cities that have become ordinary by losing their distinctive characteristics. However, cities have unique identities as memory places of societies that reproduce them throughout history as the product of a developing, transforming and dynamic process. In this context, it is important that urban design processes are designed by taking into account the historical and identity values of the city. Natural landscape features combined with cultural layers in the historical process become an important element that defines the urban identity by creating the historical urban landscape of cities. In this study, Gallipoli, which has been an important settlement since ancient era, was chosen as the research area in order to present an approach in the context of the cultural dimension of the landscape and its relationship with the urban identity. Especially in the city, which has witnessed wars and population exchanges due to its geographical and strategic location, the physical environment shaped by historical and cultural layers and the traces of tangible and intangible cultural heritage appear as elements that define the identity of the city. During the research, the identification of cultural landscape elements that define the urban identity of Gallipoli was documented with the help of visuals obtained through on-site observation method. Cultural landscape elements were followed in the context of traces, regions, nodes and landmarks, which are structural elements in defining the urban identity; it is aimed to provide a reference for the protection, management and planning strategies of Gallipoli's historical urban landscapes.

ABSTRACT

In this article, we will examine the notable similarities and shared decorations between Turkish art and Mongolian art. Both Turkish and Mongolian cultures have interacted throughout history and explored similar themes in artistic expressions. Common motifs observed between these two cultures can encompass various areas such as visual arts, decorations, and symbols. One of the most distinct shared motifs in Turkish and Mongolian art is nature and animal figures. Both cultures have coexisted with nature and incorporated artistic expressions reflecting their surroundings. Additionally, geometric motifs are frequently encountered themes in both Turkish and Mongolian handicrafts. These motifs inspired by nature can be seen as an expression of deep respect and attachment to the natural environment. Furthermore, influenced by their nomadic way of life, Turkish and Mongolian cultures exhibit similarities in the use of symbols associated with vehicles and nomadic lifestyles. Tent and nomadic motifs are significant symbols that reflect cultural identity and way of life. This article provides a general overview of common motifs between Turkish art and Mongolian art, and highlights parallels in nomadic life, symbols, and themes present in the artistic expressions of both cultures. These shared motifs stand as significant indicators of the interactions and similarities that Turkish and Mongolian cultures have experienced throughout history.

A SYSTEMATIC REVIEW OF POSTGRADUATE THESES ON ARCHITECTURAL AND URBAN DESIGN COMPETITIONS IN TÜRKİYE

Asist. Prof. Dr. Murat Çağlar Baydoğan* (ORCID: 0000-0002-7856-6712)

Erciyes University, Faculty of Architecture, Department of Architecture, Kayseri, Türkiye

Email: baydogan@erciyes.edu.tr

ABSTRACT

Objective: This study systematically analyzed the postgraduate theses on competitions, considered suitable for spatial productions and generally opened by public institutions in Türkiye. Material and Method: In this retrospective literature review, theses in architecture, urban and regional planning, and landscape architecture between 1990 and 2023 were investigated in which the term competition was used. The inclusion criteria of the theses examined in the database of the National Thesis Centre of the Council of Higher Education (YOK TEZ) were determined as the inclusion of the keywords "architectural design", "urban design", "design", and "idea" under the subtitle "competition". The titles and ABSTRACTs of the theses were searched, and the graduate theses were analyzed in terms of content. After the theses were divided into master's and doctoral theses, they were classified in chronological order and in terms of content. Findings: Out of 76 theses on architectural project competitions at Yök Thesis Center, 66 were master's and 10 were Ph.D. Of the Ph.D. theses, two focused on urban design competitions, and eight on architectural competitions. Nine master's theses were related to urban and regional planning, and one was on landscape architecture. Most theses were written after 2017, except for two in 2008. Two theses analyzed the entire competition and production process. The majority had a methodological problem and did not have concrete results. Turkish theses mainly focused on competitions in Türkiye. Conclusion: It has been observed that discursive practice, carrying conceptual knowledge, reading, interpretation, and including information on methods are generally not at a sufficient level in theses on competitions, which have spatial consequences and are considered necessary for professional practice and architecture-urban design culture. At the same time, it has been determined that academic studies at the postgraduate thesis level are not quantitatively sufficient for architectural design and urban design competitions. In this context, it is recommended to increase the number of studies on competitions, which play an essential role in informal education, make outstanding contributions to architectural culture, and raise awareness. It was observed that the number of theses increased after the periods when competitions entered the architectural agenda, and the number of advertisements increased. The general conclusion is that the relative insufficiency of the number of theses on the subject in our country, where the competition culture in architecture and urban design has not been formed, is proof that this process is not functioning correctly in Türkiye and that there are still question marks in minds due to the selection criteria, jury selection, the creation of specifications, the competition regulations of KİK and TMMOB, the low number of competitions, which is one of the democratic methods, etc.

ABSTRACT

The formation of new types of architectural and urban planning spaces should be based on the study of environmental and social needs among which an important place is occupied by ensuring environmental sustainability, which requires active use of landscaped levels. Due to the trophicity and humidity (hydrology) of the soil, the formation of the main dominant species of trees in forest ecosystems takes place. At the current stage of optimization natural environment after the active phase in the armed conflict and restoration of ecosystems in the Ukrainian Dnieper steppe, as well as in industrial settlements in the Dnipro region, acclimatization of adventitious tree species and monitoring of invasive trees in landscaped ecosystems play an important role. The region of the Kryvyi Rih iron ore basin is characterized by an extremely high level of integration industrial pollution. The leading biological and dendrometric characteristics in the method of feeding artificial woody plantations have a clear environmental condition. Indicators of the viability of artificial tree plantations in Kryvyi Rih depend on the trophic balance of incoming nutrients. They also testify that the significant factors of nutrition are the uneven seasonal soil moisture and the increased level of pollution by dust emissions from quarries, which constantly accumulates on the leaves of trees and the surface of the soil. Thus, the creation of new structures of architectural objects, which determine the nature of interaction with the environment, is impossible without comprehensive consideration of the value and ecological-environmental factors in defined urban environment.

ABSTRACT

Regional environmental safety issues have recently played a special role. Crimes against nature in the future should be considered with special care, since they have negative consequences for human existence in any region. Therefore, the scientific basis of regional environmental safety is necessary for the development of any social projects. The purpose of this work was to consider the value of introduced artificial ancient plantations as one of the key factors in the implementation of sustainable development of the ecological security of the steppe zone of Ukraine at the ecosystem level. The task of the work was to identify and assess the level of negative effects on introduced plants and predict the likely consequences of this process for the composition and structure of vegetation in the region. In order to test the research hypothesis, comparative studies of the current limits of distribution of some adventitious plants, which a few decades earlier were associated only with local thickets, were conducted. Regional ecology studies the natural environment and the impact of society on the nature of local communities ecosystems. Any human activity, whether economic, technical or social, involves interfering with the natural landscape, which leads to a violation of the balance of ecosystems. The task of regional environmental studies is to identify the causes and consequences of such violations and offer solutions to avoid harm to animals and plants. However, some changes may be irreversible. In this case, the task of regional environmental research will be to restore natural ecosystems. It is revealed that some introduced plant species can benefit from survival and settlement on the territory of the Dnieper steppe in the conditions of climate changes in recent decades.

Keywords: Violation of the Balance of Ecosystems, Crimes Against Nature, Value of Introduced Artificial Ancient Plantings.

ABSTRACT

Urban expansion in several cities have been linked with significant impacts on land surface temperature (LST). In this study, we investigate the impacts of urban expansion on Greater London within the last two decades (2000-2022). Land TRM and OLI_TIRS imageries for years (2000, 2013 and 2022) which was obtained from the USGS earth explorer was used for the study. Using these dataset, we conduct a supervised maximum likelihood classification (LULC), LST and Normalized Differentiated Vegetation Index (NDVI) analyses. We found out that there was notable (38.5%) increase in built up areas, with a corresponding increase in LST. The average temperature (19.6°C) in Greater London increased by 41.3% between 2013-2022. More so, the study found a 16.1% decrease in average temperature between the study time (2000-2022) and a 19.3% increase in average temperature between 2013-2022. Thus, indicating high rate of increase in recent times. Analysis of the NDVI for London Boroughs between the periods (2000,2013 and 2022) revealed significant changes in land use pattern and vegetation cover. There was a moderate to strong positive correlation between LST and NDVI, with R squared values of 0.476 (year 2000), 0.531 (Year 2013) and 0.621 (Year 2022). This result suggests that 73%-79% variation in LST as explained by NDVI. Findings from the study suggest an increase in land use patterns and urban expansion in London Boroughs within the last two decades. These changes portend great danger for urban environment, air quality and LST in Greater London. Based on the results from this study, we recommend sustainable land use management plan for Greater London in order to mitigate the impact of urban expansion.

ABSTRACT

This paper aims to analyze sustainable cities and the impacts of digitalization and green power generation for eco-friendly urban development. The case study focuses on Saint Petersburg, Russia, using econometric analysis to identify influential sustainability factors. Findings confirm power generation and energy efficiency policies as crucial for transforming Saint Petersburg into a smart city. Practical policies recommended include developing green financial markets, promoting sustainable education, and fostering regional cooperation on sustainable cities. Emphasizing green investments and sustainable education will accelerate the city's transition to eco-friendly practices. Collaborative efforts between neighboring regions will facilitate knowledge sharing and resource optimization. Overall, this research underscores the importance of sustainable cities and how integrating digitalization and green power can drive eco-friendly urbanization, with Saint Petersburg serving as a model for others to follow.

ABSTRACT

Ottoman Architecture in the Period of Westernization The 18th century is known as the period of opening to the West of the Ottoman Empire. It will be discussed over the Nakşidil Valide Sultan Tomb, which was built in 1818, one of the Ottoman Dynasty Tombs in Istanbul. Nakşidil Valide Sultan, wife of Abdulhamid I and She is II. Mahmud's mother. Nakşidil Valide Sultan Tomb; It is one of the important structures built by Nakşidil Sultan in 1818 within the Nakşidil Valide Sultan Complex, located in the neighborhood of Istanbul Suriçi Fatih Complex Tabhane and Fatih Mosque Cemetery. This tomb, located on the southeast side of the Fatih Cemetery, under the influence of the Westernization Period, is in baroque architectural style. The mother-of-pearl cist railings of the Nakşidil Valide Sultan Tomb, which contains many branches of traditional Turkish handicrafts such as mother-of-pearl inlay, carving and openwork, are among the most distinguished examples of its time. How is the design of the Westernization Period, the Ottoman Dynasty Tombs, the Architectural Style and the Mother-of-Pearl Cistern Fences? constitutes the research question of the study. In this study, it is aimed to determine the current conditions of the Westernization Period, the Ottoman Dynasty Tombs, the Architectural Style and the Mother-of-Pearl Cistern Fences, and to be the initial step for the restoration application with the feasibility study. The method of the study, the Westernization Period, the Ottoman Dynasty Tombs, the Architectural Style and the design of the Mother-of-Pearl Cistern Railings, on-site determinations in the Nakşidil Valide Sultan Tomb, is an original study based on the relevant literature. In conclusion; Nakşidil Valide Sultan Tomb; It is in baroque style. The mother-of-pearl cist railings of the Nakşidil Valide Sultan Tomb, which contains many branches of traditional Turkish handicrafts such as mother-of-pearl inlay, carving and openwork, are among the most distinguished examples of its time. Today, protecting, maintaining and repairing our movable and immovable cultural heritage is important to prevent major restoration works and to evaluate the current situation as undamaged in the future. These works of art need to be passed on to future generations. The mother-of-pearl inlay workmanship found in many dynasty tombs in the Ottoman Period was synthesized by using different motifs together with the architectural style.

Keywords: Architectural Style, Mother of Pearl Inlay, Traditional Turkish Handicrafts, Tomb, Cistern Fence.

ABSTRACT

Biophilic design is the field in which designs emulating nature are examined. The functional compatibility of designs inspired by nature is important for designers. Researchers working on biophilia have created biophilic design criteria by dividing the design criteria into three categories and then into fourteen sub-categories (criteria). This study aims to question the existence of spatial emulation and influence from nature in Konya Karatay Madrasah, one of the historical buildings. Konya Karatay Madrasah was chosen as an example because it is one of the important educational buildings that have been preserved from the Anatolian Seljuks to the present day. In the Anatolian Seljuk period, it is seen that the Sufism belief, which is related to the Islamic belief in madrasas, has an important place in education. According to Islamic belief, the inclusion of the infinity and absolute power of nature in the holy books requires questioning its existence in space, so this study was deemed worthy of examination. In this study based on qualitative analysis method, Konya Karatay Madrasah was spatially examined, photographed and the existence of emulation from nature was questioned through fourteen criteria of biophilic design. As a result, the presence of biophilic design criteria was observed in the spatial examination of Konya Karatay Madrasah and it was understood that there was emulation from nature.

Keywords: Biophilia, Biophilic Design, Karatay Madrasah, Emulation of Nature, Historical Space.

ABSTRACT

This study examines the impact of various entrances on the microbial quality and distribution of pathogens within residential houses. The design and usage of entrances can influence the types and levels of microorganisms present indoors. Factors such as the location of entrances, frequency of usage, and surrounding outdoor environment contribute to microbial contamination. Front entrances, being the primary point of entry, often harbor a higher diversity of microorganisms due to increased foot traffic and exposure to external pollutants. Back doors and side entrances may have lower contamination but can act as secondary entry points for microorganisms already present inside. Moreover, indoor activities and ventilation play a role in microbial quality. To maintain a healthier indoor environment, homeowners should adopt various mitigation strategies. Regular cleaning and disinfection of entrance areas, incorporating antibacterial materials, significantly reduce microbial contamination. Proper ventilation facilitates fresh air exchange, minimizing indoor microbial buildup. Monitoring and controlling humidity levels prevent mold growth, especially in basement entrances. Ensuring pet hygiene and grooming practices further mitigate indoor microbial load. Houses located near sources of pollution or agricultural operations face additional challenges, necessitating heightened attention to indoor air quality. Implementing measures such as using high-quality doormats, establishing shoe-free zones, and periodic inspection and maintenance of both interior and exterior spaces are crucial to reducing risks and promoting a healthier living environment. By proactively addressing the impact of household entrances on microbial quality, residents can create a safer and more hygienic home environment for themselves and their families.

ABSTRACT

This study intends to inform students who are enrolled in STEM courses or those who have not yet decided to pursue STEM about the realities of possible careers or professions in this field. The goal of this study is to dispel any preexisting misconceptions about what professionals, in particular architects and civil engineers, encounter while performing their duties while aiming to determine the perceptions of professionals before they stepped into their current chosen careers; and, identify their experiences when they actually began working in those particular careers. Using semi-structured interviews, the researchers found

out the perceptions and experiences of 5 Civil Engineers and 5 Architects regarding their professions. The findings revealed that the key informants had varying perceptions of the professions before stepping into their current careers. The study also highlighted the factors that led to participants pursuing Civil Engineering and Architecture, with many citing personal interests and familial influence. The study further indicated that both professions are math-intensive, although the structural design is a focus for Civil Engineers and aesthetic design for Architects. Salary expectations were found to be a common concern among participants, with some receiving salaries larger than expected, while others were disappointed with lower-than-expected salaries. The study also identified gaps in the application of theoretical knowledge to real-world scenarios and discrepancies between the expectations and realities of the professions. Finally, the study demonstrated that perceptions of the Civil Engineering and Architecture professions were subject to change if it was supplemented by further research, education, and experience.

GREEN BUILDING FOR URBAN SUSTAINABLE DEVELOPMENT

Ph.D., Elena Sierikova (ORCID: 0000-0003-0354-9720)

National University of Civil Protection of Ukraine, Kharkiv, Ukraine

Serhii Ivanov

National University of Civil Protection of Ukraine, Kharkiv, Ukraine

ABSTRACT

Green building is an important component of the urban sustainable development concept, which aims to ensure a balance between economic growth, social justice and environmental protection. The concept of green building has gradually developed with the growing public awareness of environmental protection, which also encompasses a wide range of elements. Green building is a fundamental platform for sustainable development. A solution for the multidimensional and balanced development of green building has been proposed. Since green building is a trend in the construction industry development, it provides an opportunity to mitigate the effects of global warming, achieve energy efficiency and ensure sustainable urban development. Buildings are the largest human-made objects that cause huge carbon emissions. In addition, buildings are the city's largest energy-consuming asset, accounting for 40% of the world's total energy consumption. Thus, reducing carbon emissions during the life cycle and energy consumption of buildings is the key to reduce the impact on the environment, economy and society and achieve the sustainable development goals. To promote the process of green building development, it is extremely important to raise the awareness of stakeholders. The government should launch campaigns aimed at encouraging developers and tenants to adopt green construction, which could increase the buildings value. Green building in the concept of urban sustainable development demonstrates a strategic approach to the formation of the urban environment, which is aimed at achieving harmony between economic development, social justice and environmental protection. It emphasizes the integration of technology, innovation and social aspects to create cities that provide a high standard of life quality while preserving natural resources and the planet for future generations. Green building constantly requires the search for innovations and new technologies to increase the efficiency of construction and reduce its impact on the environment. This may include the development of new materials, methods of energy saving and optimization of construction processes, which is aimed at creating a healthy and comfortable environment for residents; the use of natural lighting, ventilation and green spaces improves air quality and general well-being of people. Green building in the concept of urban sustainable development should return urbanized areas to healthier, more viable and environmentally friendly places. It contributes to the creation of cities that not only meet the needs of the present generation, but also preserve the possibilities of future generations of our planet.

ABSTRACT

Health is an integral part of human life. It is possible for a person to continue his/her vital existence and to maintain his/her life, if his/her physical and mental health can be maintained together. This is achieved by the availability of health services and the efficient meeting of diagnosis and treatment needs. In the provision of health services to the society and the individual, besides medical and technological support, it is necessary to provide care providers and the need for a qualified physical space where all these needs are met. There are family health centers in the first link of the public health service chain in Türkiye. Family health centers provide preventive and primary health care services. The patient/healthy people and their relatives in need of health services, as well as the health personnel serving here, constitute the user group of family health centers. It is necessary to plan qualified physical environment and spatial facilities that meet the needs of all these users. Within the scope of the study, institutions providing primary health care under the name of family practice in the world and family health centers in Türkiye were evaluated with current usage examples. An analysis has been provided, taking into account the spatial, functional, psychological and physical needs of users in primary health care delivery. A spatial evaluation was provided through the findings obtained within the framework of the literature-based design research. As a result of the examinations, the current design problems of family health centers with small-scale public health structures were discussed. In this framework, it is aimed to eliminate the existing design problems of family health centers and to draw attention to the need for a qualified interior design in these institutions where everyone can access health services equally.

ABSTRACT

Today, it is important to produce more ecological and innovative solutions for cities to integrate into the global system, to take part in the competition among cities and to ensure sustainability. Considering the multifaceted and complex structure of cities, achieving innovative and sustainable urbanization is a challenging process. Urban sustainability assessment tools such as LEED, BREEAM, YeS-TR have been developed in line with the necessity to consider cities as a singular and holistic system. Urban sustainability assessment tools are directly linked to sustainable development goals and address cities from ecological, economic and social perspectives. When the elements that constitute city branding such as ecological and aesthetic values, architectural structure, transportation, culture, tourism, trade and industry opportunities, local administration, education and religion are considered, it is seen that urban sustainability assessment tools have a direct positive impact on the city branding process. Within the scope of this study, the effects of LEED, BREEAM, YeS-TR urban sustainability assessment tools, which have a common purpose but have different criteria and procedures when examined in detail, on the city branding process are examined. As a result of the study, it was observed that the YeS-TR system, which is Türkiye's domestic certificate, produced stronger results.

Keywords: City Branding, Urban Sustainability Assessment Tools, LEED, BREEAM, YeS-TR.

ABSTRACT

The areas where the greenhouse gas increase, which causes climate change, is observed the most, are the cities where human activities are concentrated. Cities are both the factors that cause climate change and the areas most affected by climate change. Therefore, the steps to be taken in cities are important for the fight against climate change to be successful. The prominent actor in cities is local governments. local governments; play a key role in the fight against climate change with their jurisdictions, working boundaries, and opportunities to intervene in areas within the city that trigger climate change and are affected by the negative effects it creates. However, there are some obstacles in front of local governments at this point. The aim of this study; is to identify all aspects of the obstacles that local governments face in the process of combating climate change. In this context, semi-structured interviews were conducted with İzmir central district municipalities (11) and İzmir Metropolitan Municipality. The main finding obtained in the interviews is that the obstacles faced by local governments in Türkiye diverge from the obstacles in the world at important points. While the obstacles created by legal processes are less common in world literature, the most important obstacle encountered in Türkiye is legal obstacles and specialization. Weaknesses in climate policy and action plan preparation processes, and various legal obstacles such as authority limitations and ownership are the important obstacles faced by local governments.

ABSTRACT

The COVID-19 epidemic has had a profound influence on many parts of life, including interior design. The purpose of this research is to examine the influence of the pandemic on interior design and to identify the lessons learnt. Several research on the impacts of the pandemic on interior design have been done, including changes in teaching methods, the impact on students' writing outcomes, and the altering office interior design. The research also looks at how minimalism in design has influenced people's expectations during and after the epidemic. The study investigates the consequences of the pandemic on student learning, social interaction, and health, and proposes a hybrid working arrangement for post-pandemic interior-architecture consultants. The study's findings can assist interior designers and architects in adapting to the new normal and creating secure, useful, and aesthetically beautiful places for individuals and communities. The study's goal is to investigate the effects of COVID-19 on the interior design business and identify the lessons learnt. The study's goal is to give insight into how interior design trends and practices have changed as a result of the pandemic, as well as the problems and possibilities that interior designers have encountered throughout this period. The study draws on a variety of sources, including research papers, case studies, and conference proceedings, to present a thorough overview of the pandemic's influence on interior design. Interior designers, researchers, and experts in related sectors may find the study interesting. A comprehensive literature review was used to locate relevant publications published in academic journals for the investigation. The study examined publications on several elements of interior design, such as the pandemic's influence on teaching methods, student performance, office design, and home interior design. The findings of each article were studied in order to determine the significant trends and developments in the area of interior design as a result of the epidemic. The research emphasizes the significance of adapting interior design to society's shifting requirements throughout the epidemic and suggests incorporating new technology and techniques into the design process. The study draws on various papers on interior design and allied sectors to show how the pandemic has influenced interior design trends, instructional approaches, and workplace design. The study also looks at how interior design might help to create healthy living environments in times of crises. In the post-pandemic period, the study emphasizes the relevance of human-centered design and the necessity for hybrid working systems. The study's results emphasize the significance of adjusting to changing conditions, as well as the need for designers to reconsider their approaches to interior design in light of the epidemic. Furthermore, the study underlines the need of planning living and working environments with human well-being and health in mind.

ABSTRACT

Space, which is a multi-layered and dynamic concept, has been attempted to be understood by human beings as a physical reality that defines the space we live in, such as boundary, place or space. For the early humans, while meeting the needs of shelter as a space, they also expressed themselves by describing their lives with the pictures they drew on the cave surfaces. These descriptions have been accepted as the most primitive artistic expressions. Developing and changing opportunities in time have found various representation areas such as philosophy, literature and architecture at the intersection of art and space. The aim of this study is to examine the architectural production environment and interdisciplinary interactions we are in through the mutual relationship it establishes with art. The main question of the research focuses on how art can enable an alternative approach to the contemporary conception of space as inspiration. It is aimed to understand the dynamics of the interaction environment based on the inspiration of art for different disciplines, to reveal the ties, opportunities and potentials for the current situation and the future in the light of examples. Regardless of the definition of space adopted, producing and sharing art-inspired expressions will contribute to the establishment of an alternative framework in the interior. For this reason, the concept of space necessitates the existence of this discussion in the context of its relationship with art.

ABSTRACT

In Türkiye, the number of interior architecture / interior architecture and environmental design programs has been growing quickly since 2000. In spite of this growth, it is apparent that there are not enough educators pursuing postgraduate degrees in interior architecture. The administration of educational quality is the primary issue facing active interior architecture programs. Therefore, when evaluating the effectiveness of educational institutions, the boundaries of interior architecture should be clearly defined together with the scientific and professional domains to which it is associated. A uniform, homogenous, and strict framework governs the systems developed to assess the quality of education in interior architecture programs located in various geographic locations with various historical identities and contexts. The framework of education programs in interior architecture that enable circumstances for human development, lifelong learning, specialization from a multidisciplinary perspective, and approach global concerns with local values is still up for debate. For this reason, this study proposes ways to be heterogeneous and polyphonic through a holistic and systematic model in order to develop multidisciplinary education that supports the possibilities of technological development and socio-cultural change by focusing on the knowledge area, theory and ethics.

Keywords: Interior Architecture, Education, Field, Knowledge Area, Theory, Ethic, Holistic Model.

ABSTRACT

“Re-functioning” is one of the most important work areas for architects, interior architects, and designers to have the awareness of preserving existing cultural structures. It is possible to bring historical buildings with cultural importance that have lost their function to life in the city, by re-functioning. Many historical buildings that lost their function in the 21st century serve different functions by carrying out restoration works. Like architects, restorers, and art historians, interior architects must be conscious and highly aware designers of the protection of cultural assets. One of the most important stages for interior architecture students to reach this awareness is undergraduate education. In this direction, the subject of Biruni University Interior Architecture and Environmental Design, 2021-2022 Spring Term, Interior Architecture Project IV course was determined as "Temporary Accommodation Design" to preserve cultural assets and transfer them to future generations, and Üsküdar Paşalimanı Flour Factory (Istanbul/Türkiye) was given as the project area. Within the scope of the study, students were asked to evaluate Paşalimanı Flour Factory, which is a historical building but is now idle in the city, as a temporary accommodation function with the awareness of protection. When the final products that appeal to different user profiles are evaluated, it has been observed that the students have developed contemporary approaches that preserve the historical texture, as well as the common orientations, and have adopted the importance of the concept of conservation to a large extent.

ABSTRACT

Disasters, which have been a natural occurrence throughout history, have created many negative effects on individuals and their settlements. The century we live in causes communities to experience many crisis situations due to reasons such as natural disasters and epidemics. The chaos environment created by extraordinary and uncertain situations arising from different reasons is an important problem faced by the design discipline at urban and architectural scale. The aim of the designers in the mentioned environment is to provide resources to meet the post-disaster needs required by disaster situations and to enable the creation of post-disaster living space scenarios. This situation necessitates temporary and permanent interior scenarios that explain the post-disaster life, orientations and needs of individuals. The aim of the research is to read the existing spatial potentials and to present design suggestions for the disaster scenarios that we are likely to encounter in the current period. Within the scope of the research, new and temporary interior scenarios created by disaster situations are examined and potential interior solutions are questioned. As a result of the research, design proposals that meet the temporary order needs for the changing life flow of individuals who are disrupted in their daily life in case of disaster are presented. This study aims to understand the effective forces in the post-disaster periods to improve the reconstruction and planning processes with the knowledge gained from the research carried out and also to provide data to the academic field with policy-making authorities.

Keywords: Post-disaster, Interior Scenarios, Place Making.

ABSTRACT

Sustainability has become effective in urban planning and development processes, as in every field. Although the concept of sustainability finds its place in the upper scale in urban studies, it is a matter of debate how much it takes place in subscales such as the urban furniture scale. In order for cities to become sustainable, it is necessary to take into account the smallest component of the city and give the necessary importance in terms of sustainability. In addition to the resources spent on urban furnitures, the suitability of the urban furnitures for the health of the citizens, as well as the durability and longevity of the furniture used especially for humid coastal areas, to climate and other external factors are open to discussion. In this sense, it is necessary to examine the urban furnitures in different climates and to become sustainable and compatible with the climate and other external factors. In this context, the province of Rize, which has factors that shorten the life of materials due to its climatic structure and humidity values, stands out as a different sampling area in the research of the sustainability of urban furnitures. When the urban furnitures is examined, sitting elements come first among the urban furnitures that is constantly used by the user. In this sense, ensuring the sustainability of the seating elements will be a good start in terms of the sustainability of the furnishings in the city. In this study, the sustainability of the living elements, which are located in the coastal landscape arrangement of the city of Rize and are used quite frequently in the city, were analyzed through the MET (Material, Energy and Toxicology) matrix in their life cycles. The findings obtained from the analyzes were discussed in the direction of eco-design criteria, and suggestions were developed on how the settlement elements could be for humid coastal areas. As a result, the suggestions developed to ensure the sustainability of urban furnitures in terms of humid and rainy regions will contribute to the cities and the future of humanity.

ABSTRACT

The study examined the altitude of households towards waste management practices in urban slums of Ibadan metropolis. Oyo State, Nigeria. A multistage sampling technique was used to select one hundred and five (105) respondents from three (3) Local Government Areas in Ibadan metropolis. Data were collected with the aid of interview schedule and analyzed with both descriptive and inferential analysis. The results showed that majority of the respondents (61.0%) were female, 76.2% were married with 42.9% of the respondents age ranging between 31-40 years and 89.8% of the dwellers monthly income between #10000(\$11)-#40000(\$44). 64.3% of the respondents had households size ranging between 5-8 members and 70% of the respondents without access to government waste collection services. A significant number of respondents (94.3%) generated a high level of sewage waste while 89.5% of the respondents generated nylon waste and 83.8% reported that paper wastes were always generated and dumping indiscriminately in the study area. Also, it was revealed that the altitude of the respondents towards toward waste management were unfavorable. Gender ($X^2=0.273$), Marital status ($X^2=0.084$), membership of association ($X^2=3.591$) were found to have no significant relationship while positive relationships existed between education ($X^2= 9.466$) as well as access to waste collection services ($X^2= 8.033$) and altitude of the respondent towards waste in the study area. Also, there is a significant relationship between waste management strategies employed by the respondents and their altitude towards waste management ($r=0.360$, $p=0.000$). It was therefore concluded that altitude of the households were unfavorable to the waste management in the study area. The study therefore recommends the need for government to provide adequate funds for proper execution of environmental programs as this would secure new modern waste management technology in the study area.

ABSTRACT

In this note, we construct a new set S of primitive sets such that for any real number $x \geq 60$ we get:

$$\sum_{a \in A} \frac{1}{a(\log a + x)} \geq \sum_{p \in P} \frac{1}{p(\log p + x)},$$

Where S is a set of primitive sequences of the forme

$$A_d^k = \{p_1^{\alpha_1} p_2^{\alpha_2} \cdots p_k^{\alpha_k} \mid \alpha_1, \dots, \alpha_k, d \in N, \alpha_1 + \alpha_2 \cdots + \alpha_k = d, d \geq 1\},$$

For $d = 2$.

where P denotes the set of prime numbers.

ABSTRACT

Porous materials have been intensively studied with regard to technical applications as catalysts, catalyst supports, and adsorbents. According to the IUPAC definition, porous materials are divided into three categories: microporous (pore size < 50 nm) materials. The advantages of mesoporous materials are summarized as follows: (a) Mesoporous materials have highly ordered and controllable size which enable the size-selective adsorption of small molecules but the size-exclusion of larger molecules, providing molecular weight cutoff in sample enrichment. (b) Mesoporous materials have high surface areas and large pore volumes which provide sufficient capacity for the adsorption of reactants. (c) The framework of mesoporous materials can be various oxides, including silica, alumina, or transition metal oxides. The transition metal oxides are particularly important among non-silica mesoporous materials because they possess d-shell electrons confined to nanosized walls, redox active internal surfaces, and connected pore network. Additionally, the mesoporous structure of SBA-15 allows for easy accessibility of reactants to the active sites on the silver nanoparticles, further enhancing the catalytic activity. The tunable pore size also allows for the possibility of size-selective catalysis, where only molecules of a certain size can access the active sites.

THE ASSESSMENT OF FIAT COMPETITIVENESS IN THE EUROPEAN ELECTRIC VEHICLE MARKET (YEAR 2022)

Ph. D. Boukhedimi Chems Eddine

University of Tizi Ouzou, Department of commerce. Tizi Ouzou, Algeria

Email: chmsrko@gmail.com

ABSTRACT

The aim of this study is to check the competitiveness of FIAT 500 in the electric vehicle of some European market for the year of 2022. The electric vehicle is found to tackle the over consumption of unrenovable energies such as fuel, also, the second target is reducing CO2 emissions as the principles of sustainable development demand. As result, the model of FIAT 500 is ranked in the 3rd position of the top 10 models with 52.949 sales, followed by Dacia Spring, Volkswagen ID, Hyundai Kona electric, Peugeot 208 EV, Kia Niro EV and Renault ZOE. It should be noted that TESLA is the leader in this particular market with 108.294 sales.

ABSTRACT

Diatomite or diatomaceous earth otherwise known as infusorial earth, kieselguhr, or mountain flour. Diatomite rock is a loose, earthy or loosely cemented porous and lightweight rock of sedimentary origin, is a very important natural material used in many industries. It has distinctive physical and chemical properties. Diatomite A fine-grained, weakly cemented, porous and lightweight sedimentary siliceous rock. Depending on the amount of impurities present, its colour varies from white to yellowish, dark and brownish grey. Diatomite is a siliceous sedimentary rock consisting mainly of the fossilised skeletal remains of diatoms, unicellular aquatic plants related to algae, during the Tertiary and Quaternary periods. Diatoms are well-known for their versatility as indicators of past environments and climates. They are characterised by their low bulk density, their low thermal conductivity, and their inert chemical reactivity with the majority of liquids and gases, and their low solubility in water. Water adsorbed on the surface of diatomaceous earth and hydrated water bound to divalent cations are released at temperatures between 110 and 180°C, and insignificant amounts of water are released at 800°C. These properties make diatomaceous earth a very attractive natural material. It is characterised by high permeability, high porosity and a large surface area. Diatomaceous earths have a wide range of uses and applications such as moisture control materials, filtration materials, as raw materials for cement production, as starting materials for the production of sustained release drug vectors, sorption, desorption, purification and waste water treatment. pozzolanic material, pesticide carrier and also as a material for improving the physical and chemical properties of certain soils, immobilisation of heavy metals by diatomite etc. The review deals with diatomaceous earth on a global scale, its characterisation, its modifications and composites, as well as its industrial applications.

ABSTRACT

The objective of this study was to explore a new approach combining o study the different methods of producing electrical energy. Photovoltaic system components have also been introduced with characteristics and types of each ingredient. We will deal with the influence of temperature and the effect of irradiation on the energy produced by photovoltaic cells. The most common fossil fuels are coal, oil and gas. They are mainly composed of carbon. To use the energy they contain, man must extract them from the ground and burn them. They can be used for heating, lighting or moving around. However, each has its specificities that make it more suitable for one use or another. Renewable energies have a certain appeal when you consider that they can provide cheap and ecological electricity, to isolated residential areas, localities without means of connection to the electricity grid, but they can take advantage of techniques that have been developed to exploit natural resources. Electricity and heat. With three billion people without electricity, renewable energies can certainly play an important role and contribute to the economic development of poor regions.

ABSTRACT

This study aimed at developing Standard Electrical Apparatus for Determination of Acceleration due to Gravity amongst Undergraduates Physics Students in Niger State, Nigeria. Three research objective and three research question were raised. The study employed instrumentation research design. The population of the study consisted of one thousand three hundred and thirty five (1,335) undergraduate Physics students from which a total of thirty (30) undergraduate Physics students were drawn and used for testing and evaluating the accuracy of the instrument at five different locations using simple random sampling techniques. A validated physics practical instruction manual was used to test the apparatus. Collected data was analyzed using Mean (Σ) and standard deviation (SD) to answer the research questions. The findings of the study revealed the mean experimental values of acceleration due to the gravity of Standard Electrical Apparatus for Determination of Acceleration due to Gravity and simple pendulum were 9.83 m/s^2 and 10.47 m/s^2 respectively. On the basis of these findings, the study concluded that Standard Electrical Apparatus for Determination of Acceleration due to Gravity gives more accurate value of (g) close to the constant value than the simple pendulum. The study therefore, recommended among others that, Standard Electrical Apparatus for Determination of Acceleration due to Gravity should be adopted in the conduct of Physics practical at all level of education in Niger State, Nigeria.

ABSTRACT

Based on the shock absorber size and power and power density limitations in motorcycle application, a linear permanent magnet machine for a regenerative suspension system that recovers the kinetic energy originating from shock absorber vibration is investigated. To achieve the target power of 120 W, several design parameters were investigated. The eight-slot eight-pole combination was used due to its high power density. A hybrid permanent magnet structure was implemented which was a combination of a classical Halbach array and iron spacers. In addition, the dimensions of the permanent magnet, and stator inner radius were parametrically studied to enhance the airgap flux density and coil volume, which are the main factors affecting performance. The detailed design generated 124 W of average power under the rated condition, assuming a vibration speed of 0.157 m/s. Despite the satisfaction of the output power and power density, the large magnetic force caused by the interaction between the iron core and permanent magnet is the main drawback of this design, which has a negative impact on driving safety and comfort. To commercialize the suggested device, additional studies will focus on size, electromagnetic reduction, as well as road test performance.

ABSTRACT

Gold, one of the natural resources Nigeria is endowed with, is a precious metal with a high market value and great economic significance, with known occurrences in alluvial and eluvial placers and as primary veins in several regions of the Schist Belts in the northwest and southwest of Nigeria. Full development of the resource for mining and production around the Iperindo axis of the Ilesha Shale Belt in southwestern Nigeria has been constrained by a lack of relevant geoscience data. This work elaborates on the economic significance of gold in the area base on the examined works on geosciences research in the study region. Six Frequency Domain Electromagnetic (FDEM) and five Electrical Resistivity Tomography (ERT) profiles were occupied using Geonics EM34-3 conductivity meter and SuperSting R8/IP/SP resistivity meter, respectively, to evaluate the gold mineralization potential of the study area. Purposively collected nine soil samples and eleven stream sediments samples were analyzed. The samples were analyzed at the Bureau Veritas Minerals Laboratories, Vancouver, Canada. The acquired apparent resistivity data from the ERT profiles were inverted, using RES2DINV inversion software. The inverted ground resistivity and apparent conductivity data were sorted and gridded to generate 2D conductivity/resistivity sections, maps and 3D subsurface models, employed to characterize the subsurface. The generated geochemical data were processed using MS Excel and SPSS packages to generate different plots. The analysis indicated relatively shallow low resistivity / high conductivity zones that are primarily limited to the eastern and western edges of the study area as viable areas with potential for gold or other base metals mineralization occurring in pegmatitic veins located within identified zones. It is impossible to overstate the significance and importance of the subsurface data generated in this study, particularly for the commercial exploitation of the Ilesha Schist belt's gold mineralization potential. Instead of the growing artisanal mining operations in the area, this might generate royalty tax for the government and lead to job creation and economic growth for the local community as well as the nation.

ABSTRACT

With the worldwide increase in major accidents linked to complex production systems, industrialists are forced to design so-called safe installations. This awareness has led to more pronounced regulation and standardization. This is the case, for example, of the methodology for analysing the risks of machines and their evaluation with a view to their reduction, recommended by ISO 14121 and ISO 12100. Indeed, these standards introduce a methodology that analyzes process-risk on an ongoing and iterative basis until initial objectives are achieved. It is in this context that our work of focusing, as part of this risk analysis methodology, is integrated processes, on hazardous phenomena during the execution of tasks that require the integration of the prioritization of performance indicators. For this, we have completed this process with TPF decomposition in order to capitalize on these dangerous phenomena in order to optimize the security requirements and obtain the level of safety.

ABSTRACT

In this work, a study of the electric potential and electric field distribution is presented. The knowledge of these distributions play an important role in the design of the insulators and how to counter various problems that occur during the service of the insulator. For this study COMSOL Multiphysics 5.6 software is used which is a software based on the finite element method to study an insulator chain in a clean state and under different conditions of pollution. The electrostatic physics was chosen under a stationary study so the 3D model is simulated is made. The results showed that there are some similarities between the behavior of the electric potential and the electric field and some differences under the different conditions.

ABSTRACT

One of the most important power quality problems, current harmonics has generated a lot of study attention. The greatest way to reduce harmonic contamination is to use a shunt active power filter (SAPF), however, its efficiency is entirely reliant on how quickly and precisely its control algorithms can work. This study investigates the functioning of a four-wire shunt active power filter (SAPF) under unbalanced load situations using a simulation of a three-phase four-wire shunt active power filter (SAPF) decreased current measurement control technique caused by nonlinear loads. The suggested method for correcting the load's reactive power and harmonic currents is effective, according to simulation results produced by Matlab/Simulink.

ABSTRACT

Many studies have been done recently, notably in the geometry of the point plane, in the area of discharge and breakdown processes. In this study, a numerical model based on the experimental design technique (DOE) is provided to forecast the breakdown voltage of a point-barrier-plane structure contaminated by Minitab. A strong connection is found between the findings produced and measurement values found in the literature, confirming the efficacy of the suggested procedure.

ABSTRACT

Electrostatic forces and persistent partial arcs under HVAC stress are the main contributors to insulator pollution. Understanding this behavior is essential because contaminated insulator flashover can cause extensive, protracted power outages. Pollution flashover is a crucial factor to take into account while building transmission lines and conversion facilities, especially those used in AC systems. This work uses a two-dimensional (2D) numerical model based on the finite element method to examine how the potential and electric field are distributed throughout the model's leaking distance. The COMSOL Multiphysics simulation results obtained show that the suggested approach is successful and yields positive outcomes

ABSTRACT

Heterogeneous cavities, such as bowtie water trees, vented cavities, and air void cavities, are easily damaging to XLPE power cables. This paper studies the electrical constraints within an XLPE-insulated cable containing micro-cavities. Due to the possibility of partial discharge (PD), it is crucial to be aware of the existence of heterogeneous cavities in insulating materials before using them as cable insulation. This study examines the impact of having such diverse voids in the insulation of high-voltage cables. Additionally, using the COMSOL tool, the impact of altering the cavity's position and size on the PD behavior under various operating circumstances was examined. The obtained results are in good agreement.

ABSTRACT

Product and service marketing has always centered on objective characteristics like price, availability, and quality. Consumers, however, do not merely acquire goods and services, as evidenced by several research. Indeed, marketing scholars have been arguing for a shift in emphasis toward relationship management and value generation for a while now. Researchers and practitioners in the field of marketing have come to realize in recent years that the quality of the customer's experience is the primary variable that needs to be managed in the present. This study looked into the influence that several aspects of a brand's experience have in determining a customer's loyalty. The study will contribute to the body of knowledge by shedding light on the expanding role of brand experience aspects. Academics and business leaders alike could learn from the results of this study conducted.

ABSTRACT

In recent years, globalization-related issues, concerns about sustainability, and the need for greater competitiveness have necessitated the adoption of new transport network development strategies and models. Sustainable consumer research is receiving a growing amount of attention; yet, it is still underrepresented, and additional research is required. On the basis of these considerations, the authors of this publication conduct an analysis of consumer preferences and consumer behavior in relation to electric vehicles (EVs) as a sustainable innovation. With the introduction of cutting-edge vehicle technology such as autonomous driving systems and alternative fuel sources, the transportation sector is undergoing a dramatic transformation at an unprecedented rate. Electric vehicles have been proven to have the potential to contribute to the environmental viability of transportation systems by lowering the overall carbon footprint of individual vehicles. This article provides a comprehensive analysis of consumer preference for electric and autonomous vehicles in an effort to obtain a better understanding of consumer attitudes and behaviors regarding the acceptance and deployment of smart vehicle technology. The purpose of this study is to gain an understanding of the motivational factors that contribute to customers' preferences for electric vehicles (EVs).

MUTUAL WETTING CAPABILITIES OF OIL-WATER: POLYMER: ROCK IN SOME OIL FIELDS IN ALBANIA

Lorina Liçi

Department of Energy Resources, Faculty of Geology and Mines, Polytechnic University of
Tirana, Albania

Ardit Mihali

Alb-Petrol Ltd., Fier- Albania

ABSTRACT

As everywhere, the reservoirs are water-wet and sometimes alternate with oil-wet areas. In the case of examining the only well in Albania where polymer injection is carried out, that of Patos Marinza we see the same rule, where, as a result, with the use of wells, the saturation of the night in the reservoir decreases, and as a result, the amount of oil will be called extractable oil. As a result, the wet oil parts of the layer will be reduced and what observed is the phenomenon of water wetting of the rock. Regarding the injection of the polymer it is observed that it is greatly affected by the wettability of the core. Wettability is defined as the tendency of a liquid to spread or adhere to the surface of a solid surface in the presence of another immiscible fluid. Reservoir wettability is an important and elusive petro-physical parameter in all types of core analysis, which affects saturation and improved oil recovery processes. In the engineering concept for the exploitation of the reservoir of oil, there is the opinion that in water-wet cores, injection is done more efficiently than oil-wet cores, that is, more in the first stages of injection from water-wet rocks compared to oil-wet ones. The polymer flooding process involves the injection of a polymer "plug" followed by continuous and long-term water flooding to drive the polymer plug and the oil "bank" ahead of it toward the production wells. Based on the principle of mobility ratio as we showed above, water-soluble polymer reduces water mobility by two mechanisms: a- by increasing the viscosity of the aqueous phase, b-by reducing the relative permeability of water in the rock pores, by adsorption and retention of the polymer at the mouths of the rock pores and thus creating a more efficient and uniform front to displace the contained oil from the reservoir. The mineralogy of the analyzed samples showed a variable amount of dolomite in their composition, which consists of dolomite grains and a small amount of dolomicrite in a very fine form. The quality of the sand reservoir in Driza seems to be very good. The porous sand and pore system is practically very clean. This can create a problem with narrow pore throats. Injection of the polymer is also associated with the concern of its stability against several factors. The factors that affect the stability of the polymer, and therefore its effectiveness, are: injection pressure; temperature; stirring speed; salinity of water etc.

Keywords: Polymer Injection, Oil Reservoirs, Petro-physical Parameters, Wettability.

ABSTRACT

In Nigeria, several government reforms aimed at adopting NPM strategies at all levels has not yielded expected result, especially at the local government levels that are closer to the citizens for efficiency in social service delivery. This research aimed at examining the challenges facing the adoption of NPM strategies in the Nigerian Local Governments. The importance of local government as a driver for formulating and implementing public policy necessary for efficient and effective service delivery in Nigeria substantiate the necessity for NPM strategies that has proved effective in the developed countries. This study adopted survey research design based on positivism philosophy and deductive approach for data collection and analysis. The population of the study comprise of 8,250 staff of local governments in Lagos State, Nigeria. The choice of this state is due to unified structure of local government administration in Nigeria. The study adopted Multi-Stage sampling technique to have a sample size of 357 for questionnaire administration. Data collected were analysed using frequency distribution table, percentage and mean value to rank those challenges. The findings of the study revealed that political challenges are more severe than economic, social and bureaucratic challenges facing the adoption of NPM strategies in the Nigerian local government. The study concluded that efficient and effective social service delivery can be achieved at the local government level in Nigeria if those challenges are tackled to the barest minimum.

ABSTRACT

Afghanistan has always been at the center of attention of the global and regional actors due to its geopolitical and geoeconomic position. Throughout history, its invasion by the Persians, Greeks, Mongols, Great Britain, and Russians, as well as facing the U.S. intervention in 2001, were all related to its geopolitical importance. A power that dominates Afghanistan will also have the opportunity to control the regions such as Central Asia, the Middle East, and South Asia very easily because Afghanistan is a country that makes it possible for the above-mentioned regions to get connected and carries a "bridge role" for them. Likewise, the increasing importance of Afghanistan in the foreign policy of China, which has developed rapidly in recent years and is nominated as a hegemonic power, is undoubtedly related to its geographical location, rich minerals, and energy resources. In this study, the geopolitical importance of Afghanistan in the foreign policy of rising China will be analyzed descriptively, and while doing that, the geopolitical approaches in International Relations have been utilized. As a result of the study, it has been found that Afghanistan still maintains its geopolitical importance and the significance that China attaches to Afghanistan, its efforts to be an effective actor in Afghanistan's policies and its investments are all related to the geographical location, geostrategic and geoeconomic importance of Afghanistan. The improvement of bilateral relations after 2001 and its rapid increase especially after 2014 indicate that China will be an influential power in Afghanistan shortly. After the US withdrew from Afghanistan in 2021 China became one of the main actor in Afghanistan.

ABSTRACT

PERGAMON's (today Bergama) urban and archaeological sites; In other words, the historical city that scientists, archaeologists, architects, art historians, urban planners, sculptors and similar men of art and culture have been talking about with admiration, researching, writing about and praising for more than two thousand years, is in danger of extinction in places today. The purpose of this paper is to examine the discovery, transportation and display of the Pergamon Altar of Zeus, one of the most important monuments in the world, which was smuggled to Berlin by archaeologist Carl Humann in the 1870s and exhibited there today in the "Pergamon Museum", and to examine the demands for its restitution today. However, almost 100 years after this monumental artifact was taken, the archeology that continues today in Bergama is to explain the destruction of the area and its lack of protection. As a matter of fact, even today, many valuable archaeological pieces are still used as spolia in constructions. A small museum can be equipped with pieces that a careful eye can see while wandering the streets of Bergama. Today, traditional texture and new Especially; Removing the part of the city center that was previously an urban protected area from the protected area and making a new zoning plan for concentration for this section, Illegal settlements in archaeological areas integrated with the city, especially around Musalla Hill, Military areas located above the archaeological remains, brought the city's traditional urban texture of the Seljuk and Ottoman Periods and the two most important theaters of the Roman Period to the point of extinction.

ABSTRACT

Settlements in rural areas have a unique texture with physical transformations and social changes as they develop in the natural process. Planned settlement villages are formed by planning the rural area without developing in its natural process. Planned settlement villages transform and change over time in line with the needs of people in order to achieve their unique texture. Physical transformations and social changes in texture formation in rural areas are determined by rural morphology. Rural morphology includes elements such as street layout, building texture and settlement plan. In this study, it is aimed to examine the rural morphology of planned settlement villages in the historical process and to evaluate them with numerical data. Within the scope of the study, Böğrüdelik Village, which is an example of planned settlement villages within the borders of Konya province, was examined. This village, which was planned to solve the housing problem experienced with the forced migration of Siberian Muhajir Uzbeks between 1908-1910, has undergone physical transformation and social changes over time. In order to reveal this transformation and change, it was aimed to evaluate rural morphology through numerical data and fractal analysis method, which is a numerical data analysis, was used in this study. Fractal analysis was used to analyze the historical change of the road, axis and building texture in the field study in the context of physical transformation and social changes. The impact of these changes and transformations on the texture in rural areas is discussed.

ABSTRACT

Collaborative partnerships hold significant potential in enhancing urban social sustainability. This study focuses on promoting cultural heritage to achieve social sustainability within Ankara's urban community. By partnering with Ankara Science University (ASU), Ankara Metropolitan Municipality (AMM) initiates a public awareness campaign, displaying cultural heritage information on city water bills distributed to over 2 million subscribers monthly. The study develops a comprehensive conceptual framework, with the public awareness campaign's impact as the independent variable, exploring its influence on the development of knowledge and positive attitudes among community members. Social sustainability, encompassing overall well-being, inclusivity, and community cohesion, serves as the major dependent variable, assessed within the urban community. Moderator variables include community engagement and existing policies, both evaluated for their role in supporting the campaign's effectiveness in promoting cultural heritage and achieving social sustainability. By leveraging the shared responsibilities of AMM and its partnership with ASU, the campaign's impact is further enhanced. The research question centers on understanding the moderating variables' influence on increased urban cultural awareness. A combination of data gathered through assessments and continuous monitoring of community well-being informs the study's findings, emphasizing the crucial role of public awareness campaigns for fostering social sustainability and the significance of integrating local initiatives.

ABSTRACT

Türkiye is located in the 2nd generation earthquake zone. Especially considering the population density in Istanbul, the consequences of the possible big Istanbul earthquake are predicted to be devastating and affect a large number of people. Today, the building stock in Istanbul is classified as those built before 1980, those built between 1980-2000 and those built after 2000. With the accelerated urban transformation works since 2009, according to the IMM report, 30% of the existing housing stock has been transformed after 2000. (2019, IMM Istanbul Province Probable Earthquake Loss Estimates Update Project Report). After the 2011 Van earthquake, the Law and Regulation No. 6306 on the Transformation of Areas Under Disaster Risk regarding the possible risky structures were published. The published regulation does not include an effective process planning for the transformation processes of risky structures. Currently, 70% of the building stock in Istanbul needs to be converted against possible disaster risk within the scope of Law No. 6306. It is indisputable that the disaster risk is permanent and dangerous and the transformation process needs to be completed quickly. At this point, a case study was conducted regarding the possible disruptions (time, cost) experienced in the transformation processes. A Case study was conducted in scope of the residential building located in Bakırköy district, Baharlı Bahçe Street, no:15 map: 232 block:7 parcel, was completed in the urban transformation project, which was completed within the scope of the law numbered 6306. Semi-structured interviews were conducted with the owners and contractors of the building mentioned in the analysis. During the interviews, it was examined at which stages of the project the time-cost overruns were encountered during the completion of the project. As a result of the interviews, it is aimed to determine at which stages of the ongoing urban transformation projects the problems intensify, and to create a resource for the proposal of process management models.

Management and Finance, Warsaw, Poland

Email: awojci5@sgh.waw.pl

ABSTRACT

Water management in communes in Poland belongs to the commune's own tasks. As part of this task, the commune is obliged to organize the supply of water to residents, as well as the disposal of sewage. Regardless of the legal form of the water supplying entity, until 2018 the level of tariffs was ultimately controlled by the commune council, which approved the level proposed by the said production entity. From 2018, in Poland, this function was taken away from municipalities and the State Water Holding Polish Waters was established, which took over the function of the central controller of the water fee tariff. Many local government officials question the need for such a deep interference in the tariff policy for water and sewage disposal of the central authorities in Poland. In this way, it is accused of reducing the independence and self-government of communes and, from the point of view of social costs, their unnecessary increase due to the additional entity included in the system of production and supply of water to residents. The aim of the article is to assess the legitimacy of centralizing the tariff policy for water supply and sewage disposal in Poland. Although a similar system of central approval exists in relation to electricity prices and is implemented by the Energy Regulatory Office, in relation to the good of water, this may be a debatable matter.

ABSTRACT

Currently, in connection with the UN Sustainable Development Goal No. 11 adopted by the world community, the general direction in the field of modern urbanism is the implementation of the concept of smart cities, which are aimed at achieving environmental sustainability, social sustainability and economic viability. A key role for the successful solution of this problem is the creation smart cities of a sustainable passenger transport infrastructure based on those types of transport that have zero emissions. In this regard, such a type of electric transport as aerial rope systems has good prospects as a sustainable public transport in smart cities. The prospects of its use were investigated within the framework of a grant from the Russian Science Foundation (project No. 22-29-00798). The transition to the use of rope systems provides a significant reduction in CO₂ emissions into the environment. Existing passenger ropeways contribute to the implementation of the principle "car-free cities", contribute to solving the transport problems of cities and increasing the mobility of the population. This is due to the fact that in conditions of dense urban development, the ground tier cannot cope with the growing flow of transport, and the possibility of expanding land highways is limited or simply absent. The transfer of traffic flows to the aboveground space significantly increases the mobility and stability of passenger transportation due to the absence of traffic jams, traffic accidents, the presence of traffic lights and pedestrian crossings, etc.

ABSTRACT

With the increase in urbanization, the amount of green space needed by individuals is decreasing. Vertical garden applications play an important role in the new living order in order to increase the amount of green space and add both ecological and aesthetic value to the environment. For cities that tend to grow vertically as a result of concreting pressures, vertical gardens should also accelerate with the same acceleration and take their place in the urban landscape with correct and appropriate applications. Vertical gardens, which can be applied on building surfaces and platforms, have many benefits such as screening, cleaning dust particles in the air, heat-sound insulation, orientation and limitation. Vertical gardens reduce the stress of individuals living in cities by reducing the pressures of city life and helping to reduce their physical and psychological problems. They provide a spiritual and physical connection with nature. In the study, vertical gardens in the city center of Rize were chosen as research material. The study was carried out in two stages. In the first stage, the literature related to the subject was searched, and the definition, history, benefits, application systems and examples of vertical gardens were revealed. In the second stage, a survey was conducted with the city users in order to determine the sufficiency levels of the vertical gardens in the Rize city center and to examine their effects on the urban identity, and the results were evaluated.

ABSTRACT

With increasing environmental problems, the usage of non-motorized vehicles such as bicycles has gradually increased. Beside sustainable transportation, bicycles are also used for recreational and sports purposes. Bicycle roads with adequate infrastructure and built in appropriate sizes provide users a healthy and safe experience. With the bicycle road project in the city center of Rize, an area where local people can participate in sustainable transportation and do sports has been created. Local governments aim to create an uninterrupted bicycle road throughout the city center in addition to this actively used area. The aim of this study is to identify and examine the bicycle roads in the city center of Rize, to identify the problems of bicycle users and to develop suggestions that will increase bicycle use in line with these. In this direction, in the first stage, urban bicycle roads were determined and the necessary measurements were made and the suitability of the paths for use was determined. In the second stage, the opinions and suggestions of the users about the field were taken with the survey study. And with the observations made in the area, the usage changes between night and day and the changes due to the weather conditions were determined. By evaluating the data obtained, suggestions were presented to increase the suitability of the area for use and to increase the use of bicycles in the area.

ABSTRACT

The aesthetic term has been a part of the philosophy and psychology disciplines as well as architecture and urban studies recently. Changing technology and social norms also affect the aesthetic notion of the environment. Some other studies also mentioned that socio-demographic, cultural, and historical background impacts the aesthetic. So, while the aesthetic term has been examined in various contexts, the senses perceive it, and visual is the most dominant among others. However, other senses also accompany perceiving and understanding urban life, and the auditory sense is somehow under-explored in conjunction with the aesthetic and urban environment. Auditory sense includes a greater potential for having both physiological and psychological effects on aesthetic concepts. This study aims to assess the auditory perception of the acoustic environment regarding aesthetic concepts. To understand such association, the study performed a quantitative approach on Cumhuriyet Avenue that includes unique historical, social, and built environment attributes in the core city. Next, the researchers identify various aesthetic-oriented scenarios regarding the auditory sense. The study results show that aesthetics and sound have a great association, and sounds can be used for archival and preservation purposes based on the collected sound samples and measurements.

ABSTRACT

In this study, it is aimed to understand the position of the artistic spaces created by designer Hasan Ragab using the Midjourney program, one of the increasingly important artificial intelligence technologies, at the intersection of architecture and art. Within the scope of the study, a total of six space models with three different forms and functions were selected using the random sampling method from the artistic spaces created by Hasan Ragab with the Midjourney program. The evaluations of individuals who have received or are receiving education from any of the design disciplines regarding their views on the selected works in the context of creative design principles were analyzed through a detailed questionnaire. The research was applied to a total of 200 participants from 6 different design sub-professional groups. As a result of the research; it was determined that artificial intelligence provides accessibility to many people who do not have artistic skills, Midjourney is a research laboratory that works on artificial intelligence and has created its own program, Midjourney, an online platform, produces art based on a text entered into the software, and an architectural design can be transformed into an artistic work with the use of Midjourney, and it has been determined that the designers who experience the Midjourney platform to create their spatial designs are not in the majority as of today. In addition, according to the expert opinions obtained as a result, the use of Midjourney artificial intelligence program is one of the principles of creative design.

ABSTRACT

The aim of this study is based on the reuse of architectural and industrial parts from different disciplines used for different purposes in new buildings. Sustainable materials used in interior design affect not only material development but also the fundamental transformation of space design to some extent. This study takes materials in the interior and industrial design industry as an entry point, selects adaptable and reusable materials with the concept of sustainability, examines the natural and social properties of materials in depth, and describes the application process of these materials in interior spaces. Two types of materials were used within the scope of the study. As the first material, publications on adaptive reuse with emphasis on theoretical and visual information are publications, thesis studies, lecture notes, architectural and interior design printed publications and internet resources. The scanned and analyzed information is handled from general to specific. As a result of the research, industrial vehicles used for different purposes and the use of independent parts and accessories used in architecture in harmony in interior design are discussed. This study will determine how adaptable reusable materials affect the working comfort of office workers and customers and will be a reference for interior designers in this regard.

ABSTRACT

Since the early days of documented history, people have eaten mushrooms. The Greeks thought that eating mushrooms gave warriors more power in combat, while the Romans thought of them as "Food of the Gods." Mushrooms have long been revered in Chinese culture as a nourishing food and a "elixir of life." They have been a part of human society for countless years, and because of their sensory qualities, they have piqued people's interest in the most significant civilizations in history. They are also known for having appetising culinary qualities. Because they are minimal in calories, carbs, fat, and sodium, as well as being cholesterol-free, mushrooms are valued foods in today's society. These are a good source of minerals including iron and phosphorus, as well as vitamins like riboflavin, thiamine, ergosterol, niacin, and ascorbic acid. They also contain bioactive components such as secondary metabolites (terpenoids, acids, alkaloids, sesquiterpenes, polyphenolic chemicals, lactones, sterols, nucleotide analogues, vitamins, and metal chelating agents) and polysaccharides, primarily beta-glucans and glycoproteins. Biologically active compounds in mushrooms make them potential hepatoprotective, immune-potentiating, anti-cancer, antiviral, and hypocholesterolemic drugs. Due to their low fat and high fibre content, as well as the fact that they are one of the main sources of natural antioxidants beneficial in lowering oxidative damages, they have a tremendous potential to prevent cardiovascular illnesses. The objective of this review is to give readers a thorough understanding of commercially grown,

ABSTRACT

Background: Currently, the need of power consumption is important to develop cities and industries. There are numerous traditional methods of receiving the amount of power for the needs but they are threats of environmental pollution. This is why we need to focus on alternative methods of receiving power. **Aim and Objectives:** Green energy can be considered an effective means of promoting the amount of energy needed for industries, urban territories, and businesses without damaging the environment. Green energy is typically derived from renewable energy technologies such as solar, wind, geothermal, and hydroelectric electricity. The best option for improving environmental sustainability and having no negative effects on the nation's economic growth is renewable energy. **Findings:** Notably, one of the primary aims of sustainable growth is to assure the availability of energy sources for future generations while spending as little money and emitting as little pollution as feasible. Green energy has therefore attained the aims of sustainability, i.e., they are the least costly, most effective means to increase the sustainability of a nation's productive sector, people's standard of life, and the environment. **Conclusion:** The main focus of this work is the production, utilization, and implementation of green energy sources globally. We are alone responsible for saving the planet from extinction because we are the ones who pollute it. The article primarily focuses on the advantages, necessity, and need for green technology for a brighter future.

ABSTRACT

Antimicrobial resistance (AMR) has become a significant global health issue and poses serious risks to the world's public health and healthcare systems. The worrisome spread of AMR and its significant effects on society are explored in this ABSTRACT. The management of infections that were once manageable becomes more and more challenging as microbial agents continue to acquire resistance to antimicrobial medications, prolonging illnesses, raising mortality rates, and raising healthcare expenditures. The paper investigates the numerous elements causing AMR to spread globally. It draws attention to the indiscriminate use of antimicrobial substances in both human health and agriculture, which has aided in the emergence of resistant microorganisms. The One Health concept also highlights how intertwined human, animal, and environmental health are, emphasising the necessity of coordinated actions to address AMR. In addition, the idea of antibiotic stewardship is emerging as a crucial approach to combat AMR. Healthcare practitioners can prevent the emergence and spread of resistant microorganisms while improving patient outcomes by encouraging prudent antibiotic usage. In this paper the main emphasises on the financial effects of AMR by showing how the growing demand on healthcare systems strains finite resources and compromises the viability of international health efforts. The susceptibility of underserved populations and their lack of access to efficient antimicrobial therapies are also examined, highlighting the significance of equity in healthcare interventions. This ABSTRACT concludes by highlighting the seriousness of the global burden of antibiotic resistance and arguing in favour of proactive steps to lessen its effects. Key elements of the strategy include enhancing surveillance, putting in place programmes for antibiotic stewardship, and raising public awareness.

Keywords: Antimicrobial Resistance, Global Burden, Public Health, Healthcare Systems, One Health, Antibiotic Stewardship.

ABSTRACT

Through this scientific research, we have tried to study the effect of the incorporation of plastic waste on the mechanical properties of concrete, in order to obtain good concrete with high resistance at a lower cost. To carry out this work, we adopted the following steps: Knowledge of the properties of concrete, which contains plastic waste of High Density Polyethylene (HDPE). Thus, the natural aggregate was replaced by concrete formulated with plastic waste in partial substitution varying between 0%, 10% and 20%. In all the concrete mixes, the components, water, cement, 3/8 and 8/15 gravel and 0/3 sand, remained constant while HDPE waste, varied according to the substitution rate. Through this process, the mechanical properties of concrete in the fresh and hardened state were determined. The analysis of the results of the study allowed us to know the incorporation of plastic waste and its effect on the behavior of the manufactured concrete. The results showed that the density of concrete made from waste plastics is lighter than the reference concrete without waste (C0), which contains only natural aggregates, in the fresh state. In the case of hardening, the results showed a decrease in the compressive strength of the composite concrete produced from plastic waste compared to (C0) the reference concrete.

ABSTRACT

A study was carried out in Ikot Ekpene, Southern Nigeria to determine the quantity and quality of waste produced in a number of Poultry farms. This is done with the goal of understanding the status of current waste creation in the environment and recommending the best management practices to safeguard the air, surface, and groundwater ecosystem. In the farms, questionnaires focusing on agricultural information and poultry information were given out. Findings from the questionnaires and observations revealed that a total of 2,249,470 birds, or 1,109,600 layers, 743,300 broilers, and 396,570 cockerels are reared annually in confinement at the farms covering an area of 97 acres per hectare. According to calculations, the farms produce 65.76 metric tons of dead birds over the course of a brooding cycle and about 32398kg of poultry trash; Layer's waste - 14735kg, Broiler's waste - 9871kg and Cockerel's waste - 7792kg which excludes litter from slaughterhouses and garbage from hatcheries. Poor waste management is evident in the farms visited, where main waste management practices include burning and indiscriminate land disposal. Few embrace the re-feed strategy, and those that do bury the deceased birds. To protect Ikot Ekpene environment from immediate dangers, this trash generation and control or management system must be modified. For Poultry farmers in Ikot Ekpene, modern management strategies like composting, gasification, and biogas production are advised because they are more environmentally friendly and may produce resources from waste.

ABSTRACT

Deep learning techniques have been prosperously applied in many areas of computer vision, including colorization of greyscale images and additionally in amending the resolution of the image. But both of these were never utilized in a cumulated approach to get a super resolution colorized image of a grayscale image. As a component of our major project, we have studied through sundry techniques involved in image colorization and super resolution of the images and propose our amalgamated approach for the colorization of greyscale images and subsequent amelioration of their resolution. In our approach, we mainly focus through two different architectures of neural networks namely, Convolutional Neural Networks and Generative Adversarial Networks. We amalgamated both of these networks to perform Image Colorization and Super resolution respectively. Our model distributes an enhanced colorized image of low resolution grayscale image which was never visually perceived in subsisting models.

ABSTRACT

As we have moved most of our financial, work cognate and other daily activities to the cyber world, we are exposed to more preponderant risks in the form of cybercrimes. URL predicated phishing as ailments are one of the most prevalent threats to the cyber world users. In this type of assailment, the assailer exploits the human susceptibility rather than software imperfections. It targets both individuals and organizations, induces them to click on URLs that look secure, and purloin confidential information or inject malware on our system. Different machine learning algorithms are being utilized for the detection of phishing URLs, that is, to relegate a URL as phishing or legitimate. Researchers are perpetually endeavouring to amend the performance of subsisting models and increment their precision. In this work we aim to review sundry machine learning methods utilized for this purport, along with datasets and URL features used to train the machine learning models. The performance of different machine learning algorithms and the methods used to increment their precision measures are discussed and analysed. The goal is to engender a survey resource for researchers to learn the current developments in the field and contribute in making phishing detection models that yield more precise results.

ABSTRACT

Copper molybdate is among the most studied ternary oxides in the family $AMoO_4$ (A is a transition element or a divalent metal from the alkaline earth column). According to the literature, $CuMoO_4$ possesses five allotropic forms α , β , γ , II and III depending on the synthesis conditions, the temperature and the pressure. Indeed, under atmospheric pressure, the copper molybdate can be detected in two crystalline forms. In fact, it can be in the stable form located at a medium high temperature, α - $CuMoO_4$, in which Mo is tetrahedrally coordinated, or it can have an octahedral coordination in the metastable low temperature (below 190K) form, γ - $CuMoO_4$.

In this work, we synthesized α -CuMoO₄ in the solid state utilizing a new and simple process, without resorting to any solvent at relatively low temperature. The as-prepared copper molybdate nanopowders were readied through calcination of an oxalate complex in static air at 550°C. The oxalate complex was investigated by TGA and FTIR spectroscopy. The as-readied α -CuMoO₄ was characterized by XRD, and BET technique. Its catalytic effectiveness was verified in the reduction reaction of the nitrophenol isomers. The copper molybdate exhibits exceptionally high reduction reaction of the three isomers of nitrophenol to the three corresponding aminophenol isomers.

ENVIRONMENTAL ASSESSMENT OF INDISCRIMINATE REFUSE DISPOSAL IN ARIGBAJO AREA OF OGUN STATE, NIGERIA

Oguntade Omotolani I.

Department of Civil Engineering Ogun State Institute of Technology, Igbesa

Email: oguntadeomotolani@gmail.com

ABSTRACT

Improved economic activities in some parts of Nigeria have led to increased population and this has also increased waste generation in those areas. Ways and manners by which refuse generated from different households are being disposed carelessly on the streets has led to environmental degradation and public health concerns. This present study aimed at assessing the environmental impact of indiscriminate refuse disposal in Arigbajo, Ifo Local Government area of Ogun State, South-Western Nigeria, and was carried out using self administered questionnaires for 60 households within 100metres of the refuse dumps. Solid wastes generated in the study area are composed of paper, rags, metals, food wastes and polythene. The result obtained from the findings shows that numerous open spaces are used as dumpsite which constitute nuisance to the environment. The research revealed that there is no structured waste disposal system in the study area, leading to its vulnerability. It was also discovered that unpleasant smells emanate from the dumpsites and there is prevalence of diseases like malaria fever, cholera, diarrhea and meningitis among the inhabitants. Effect on the Infrastructure is evident due to clogging of water channels by some of the non-biodegradable waste materials such as papers and rags. It is therefore recommended that persistent environmental management campaigns through public health education and adequate funding of solid waste management should be encouraged.

ABSTRACT

Cellulose pulp obtained from pulp wood fiber or grasses is pressed, then it is obtained to be dried in flexible sheets. Any kind of paper, cardboard and cardboard that completes its function in all kinds of use and is discarded are defined as wastepaper. In this context, paper mills newspapers published by printing companies are also considered as wastepaper. This study covers the investigation of the effect of waste material on of cement-based mortars. Paper fiber wastes taken by volume in different proportions added to the mortars. Silica fume was used as a pozzolanic binder by replacing the cement in different proportions by volume. The exact values of the proportions was determined by trail mixes. Compressive and flexural strength of mortars were obtained by testing the hardened samples. Among the samples containing paper fiber, the highest compressive strength values were measured as 20.09MPa, 23.99MPa and 28.95MPa for 7, 28 and 90 days samples. While the hydration continues with the curing process strength of the mortar increases over time but the contribution of the fibers in the mortar doesn't increase. Therefore, as the number of the days before specimens are tested increases, the contribution of paper fibers to the mechanical strength decreases by percentage.

ABSTRACT

Geopolymer composites have recently become a promising ecological alternative to conventional cementitious materials. They are environmentally friendly, and their production requires relatively little energy. The research to examine the use of fibers in geopolymer mortars as well as to reuse the wastes that cause environmental pollution. For this purpose, industrial waste silica fume and basaltic pumice (scoria) were used in the production of geopolymer mortars and were reinforced with wastepaper fibers. In order to determine the physical properties of the produced samples, fresh state unit weight, true density, water absorption, total porosity was obtained by using the relevant tests and formulas. By comparing the obtained data with the control samples, information about usability of cellulosic fibers in geopolymer mortars was obtained. The hydrophilic nature of the paper fibers is the main reason for the water absorption of the geopolymer mortar. Therefore, it was observed that the water absorption percentage increased with the increase in the paper percentage. Since the specific gravity of the fibers in the mortar is 0.93 cm³, the increase in the fiber ratio caused the density to decrease as expected. Increasing the molarity enables the geopolymer matrix to form a stronger, void-free, and tight structure. Therefore, it has a more compact structure compared to the other mixture with a higher molarity than the samples with the same paper content.

CLAY BRICKMAKING TECHNIQUES (TRADITIONAL – MODERN TECHNIQUES)

Kaltrina Spahiu

University of Prishtina - Faculty of Architecture, Prishtina, Republic of Kosova,
Faculty of Civil Engineering, University "Ss. Cyril and Methodius", Skopje,
Republic of North Macedonia

Email: kaltrinaa.spahiu@gmail.com

ABSTRACT

The art of crafting clay bricks has been an ancient and well-recognized trade in the realm of construction, dating back to antiquity due to the historical usage of bricks as building materials. In modern times, this technique has evolved significantly, owing gratitude to the advancements in construction technology alongside material knowledge enhancements. Amidst these advancements, the traditional technique of brickwork remains a renowned tradition within small family-owned businesses. These enterprises uphold the fresh application of the age-old methods of brick crafting, a practice that has persisted in Balkan region households until recent decades, whether for personal necessity or commercial purposes. The process of crafting bricks using primitive tools itself holds inherent tradition, yet the amalgamation of traditional practices with modern ones has become a method utilized in my doctoral research. A fragment of this combined approach will be presented within this discourse. The information presented herein is a culmination of research employing various methodologies including analytical, synthesis, statistical analysis, and generalization. This study showcases the method of natural clay selection, its combination with water, mixing techniques, the shaping process, drying, and firing. Consequently, the results will demonstrate the craftsmanship of bricks adhering to European standard dimensions. These outcomes underscore that the fusion of traditional and advanced practices can yield bricks suitable for contemporary construction purposes.

ABSTRACT

Design of elevators is the most important planning criterion for designing an effective and efficient vertical transportation system in high-rise buildings. Elevators are placed generally in the core in high rise buildings. Thereby the location and number of the core, user's time that takes for reach the elevator, transit time and transportation capacity of the elevators are the basis of elevator design. The aim of this study is to reveal the design approaches of elevators both in vertical and on plan. Considering these approaches will be important for design and application decisions of high-rise buildings. In this study, the user traffic in high-rise buildings was explained. It has been seen that the elevators grouped together increase the efficiency of transportation. Then, the vertical zoning of the elevators and their arrangement on the plan are explained. It has been seen that the vertical zoning of the elevators is important in controlling the elevator number in the building and limiting the space occupied by the core on plan. In terms of grouping of elevators on plan should be considered that user's opportunity to see and reach each elevator cabin in a short time. Elevators which design in central cores are considered advantageous when design provides suitable distance to vertical transportation elements and escape routes for users. Also elevators which design in edge or external cores considered that should be design as multiple for ensure vertical transportation efficiency in long floor plan.

ABSTRACT

The concept of metaverse has been known for decades as a virtual experience place, but the term caught public attention when it was rebranded as "Meta" during Covid-19 and has come to be defined as the future second world. Many cities located on different continents, such as Santa Monica, Seoul and Shanghai have started to develop urbanization strategies through metaverse in order to have a place in the metaverse world. With all these developments, metaverse is predicted to go beyond the ordinary by making radical changes in our lives on different scales, from the life of society to architecture and onwards to the planning of future cities in the near future; it has also raised debates and questions about urban space, context, urban experience-memory and socio-spatial inequalities. In this vein, while adopting a qualitative research method, this study brought together the literature on the metaverse and the subject was discussed with a critical point of view under three headings as the right to the city, the limits of urban and architectural space, and socio-spatial polarization. The subject is examined in detail over Liberland, which is the first metaverse country designed by Zaha Hadid Architects, chosen as the paradigm. As a result, although it is undeniable that the relationship between metaverse, city and architecture has many possibilities and potentials, it has many unknowns in terms of urban experience, contextuality, and integration into physical and daily life.

ABSTRACT

People have tended to migrate constantly from the past to the present. People who migrate and adopt the nomadic life have always been in search of a way of transportation, and they have shaped history by discovering new methods. One of the most fundamental motions that mankind has ever used to perform daily tasks is walking. Studies show that walking is good for human health, both physically and mentally. At the same time, walking reduces the use of motor vehicles, increases the physical activity of people, and reduces the use of fossil fuels in the city. For this reason, the increase in the number of people walking in cities makes a positive contribution to urban people and urban ecology. This situation has revealed the concept of "Walkability". The concept of walkability is defined as "the built environment providing an environment that supports and encourages walking by providing visually interesting vistas that will enable pedestrians to reach certain points in a safe and comfortable way". Creating walkable environments provides people with recreational opportunities while providing solutions to reduce environmental pollution. In this study, it is aimed at emphasizing the contributions of walkable cities to urban ecology and urban health. As a result of the study, suggestions were made for the creation of walkable cities by examining the reduction of harmful gases emitted in the cities by ensuring walkability and its contribution to reducing the carbon footprint and thus preventing climate change.

ABSTRACT

The intensive use of cement in construction is a significant environmental concern. The cement industry is the primary source of environmental pollution as it intakes a huge amount of energy in the production and releases a lot of CO₂, which contributes to global warming. To reduce the use of cement for energy consumption, the use of supplementary cementitious materials (SCMs) like Fly ash (FA) and Silica fume (SF) in concrete is an interesting solution. FA and SF-based construction materials offer a lot of potential as alternatives to ordinary portland cement (OPC) because of their high performance and environmental friendliness. The level of replacement and the necessity for additional cementitious content are critical considerations when choosing the most sustainable material for concrete production. The present investigation is focused on the development of sustainable concrete using FA and SF as SCMs. Two binary mixes were developed by using FA and SF. The FA was substituted at 20%, 30% and 40%, and SF was substituted at 5%, 7.5% and 10% by weight. The ternary mix is prepared for constant percentages of silica SF like 5%, 7.5 % and 10%, the cement is further replaced with FA (20%, 30% and 40%) by weight to create ternary blended concrete. The mechanical properties such as compressive strength, split tensile strength, flexure strength, and durability characteristics such as sorptivity, rapid chloride penetrability and also micro structure analysis such as XRD, SEM of both binary and ternary mixes were studied. Besides this the cost-benefit analysis, environmental impact assessment and sustainability index for control, binary and ternary blended concrete mixes was also studied. The results of binary mixes show that the incorporation of SF and FA significantly impacts workability. The use of SF considerably increased concrete's early and long-term strength, whereas FA lowered early-age strength; nevertheless, it enhanced long-term strength. It was concluded that the SF contributed to better durability properties than FA. FA at 30% and SF at 10% exhibited the desired strength and durability than OPC. When compared to OPC concrete, the results show that ternary concrete mix containing both FA and SF as a partial replacement for OPC can significantly improve strength and durability. Meanwhile, when compared to control OPC concrete and other ternary mixes, a ternary concrete mix containing 30% FA and 7.5% SF performed better. Furthermore, cost analysis, environmental impact assessment (CO₂ emissions), and sustainability index revealed that concrete built with FA and SF was less expensive, had less CO₂ emissions, and high sustainability than concrete made with OPC. Designing ternary concrete with FA and SF could aid in producing clean and eco-friendly concrete.

ABSTRACT

This study explores the intricate relationship between eco-literacy and economic development in the context of Nigeria. Eco-literacy, defined as the understanding of ecological principles and the capacity to make informed decisions for environmental sustainability, has gained increasing significance in light of global environmental challenges. In Nigeria, a country which is rich in natural resources but facing environmental degradation, the interplay between eco-literacy and economic development presents a critical avenue for progress. This paper delves into the multifaceted ways in which eco-literacy can drive economic development. As the nation seeks to diversify its economy beyond oil dependency, embracing eco-friendly practices and industries can foster innovation, create jobs, and enhance global competitiveness. Furthermore, a populace equipped with eco-literacy can advocate for sustainable policies, leading to the preservation of natural resources and reduction of ecological footprints. Conversely, economic development provides a platform to promote eco-literacy. Increased access to education and awareness campaigns can empower individuals with the knowledge to make environmentally conscious choices. Investments in eco-friendly technologies and infrastructures can mitigate environmental degradation and enhance overall quality of life. However, challenges such as inadequate environmental education infrastructure, socio-economic disparities, and policy implementation gaps must be addressed to fully realize the potential of this symbiotic relationship. Through qualitative and quantitative analyses, the paper examines successful eco-literacy initiatives and their impact on economic sectors like agriculture, energy, and tourism. In conclusion, fostering eco-literacy in Nigeria can catalyze a positive feedback loop, whereby economic development drives eco-literacy and vice versa. A comprehensive approach that integrates education, policy, and sustainable practices is essential for harnessing the benefits of this synergy, promoting long-term economic growth, and safeguarding the environment for future generations.

Keywords: Nigeria, Eco-literacy, Economic Development.

THE ENVIRONMENTAL AND ECONOMIC IMPACTS OF THE USE OF RECYCLED ASPHALT DURING THE PREVENTIVE MAINTENANCE OF ROADWAYS IN THE UAE

Associate Professor Aishah H.O. Al Shehhi*

The British University in Dubai, United Arab Emirates

Gul Ahmed Jokhio

Structural Engineering, The British University in Dubai, United Arab Emirates

ABSTRACT

Roadways are one of the significant important elements in infrastructure because they are characterized simply as the point of interaction between societies and people. Mainly roadways have been the main source by which whole economies and societies have emerged and developed over the years. They also made a positive contribution to the distribution of ideas, cultures, languages, discoveries, goods, and services of having better and safer roadways. This study seeks to assess the application of recycled asphalt in roadway maintenance by comparing it to the current roadway maintenance procedures in terms of technical parameters in construction procedures, timelines...etc. This will enable the study to identify the possible benefits of using recycled asphalt pavement in roadway maintenance. One of the benefits of using this construction material includes the economic benefits of saving on cost in material consumption, energy conservation in the processes, and environmental protection, which are imperative attributes in the development of sustainable human activities. However, other studies have indicated that asphalt has numerous disadvantages that should be considered before it can be fully adopted. Some of the challenges regard the technical aspects, mechanical considerations, and other quality concerns. This implies that while recycled asphalt can be used as a sustainable material, there is a need to conduct an in-depth analysis to verify and quantify the effectiveness of the material, where the information is limited in the current literature. This study addresses the importance of using recycled asphalt with the integration of road maintenance procedures in the road network. This element is considered the main element of any national infrastructure development plan. The research aims to study and highlight the using recycled asphalt as a suggested sustainable method for road maintenance procedures. Therefore, the study elaborates on the historical use of recycled asphalt, its advantages, and disadvantages. Besides that, the maintenances process categories to ensure the suitable type that ensures the best quality of the network. Since roadway pavement assessment is based on quality as well as different characteristics parameters such as rutting, cracking, pavement quality Index, and roughness. The realization of addressing the factors is an important matter to prevent any threats and challenges during the life cycle of the road network. This can be done by establishing a new implementing process such as using recycled asphalt in pavement rather than the traditional pavement. The new process may provide unique outcomes from environmental, social, and economic perspectives and dedicate policy and strategy to enhancing the quality of roadways. In addition to other parameters. The selected case study for this research is the Dibba-Masafi E89 roadway in UAE where the research methodology is conducted by elaborating the current situation of the roadway performance and the conduct recycled asphalt as solution to ensure better performance.

Keywords: Recycled Asphalt, Roadway Maintenance, Pavement Parameter, Condition Index.

ABSTRACT

The objective of this study was to explore alternative materials for the production of environmentally friendly concrete. An experimental investigation was conducted to evaluate the mechanical performance of different concrete types using either natural sand or sand derived from blast furnace waste (granulated slag). Three concrete variations were examined: ordinary concrete, concrete with 50% replacement of natural sand with granulated slag, and concrete with 100% replacement of natural sand with granulated slag. Mechanical tests were performed to assess compressive strength, splitting tensile strength, flexural tensile strength, and Young's modulus. The results revealed that the compressive strength of the concrete with 100% granulated slag sand was 25% lower than that of ordinary concrete, but still within acceptable limits. However, the flexural tensile strength of the concrete with 50% granulated slag sand increased by 15% compared to ordinary concrete. It is worth noting that the use of 50% granulated slag sand in the concrete had a detrimental effect on its compressive strength.

Keywords: Mechanical Performance, Granulated Slag, Compressive Strength, Splitting Tensile Strength, Flexural Tensile Strength.

ABSTRACT

Mobility is of vital importance for urban sustainability, as it affects various aspects of everyday city life. Efficient and sustainable mobility systems reduce congestion, air pollution and carbon emissions. The share of movement of goods in urban traffic can vary significantly based on factors such as the size of a city, its economic activities, transportation infrastructure, and urban planning. However, in many urban areas, the movement of goods accounts for a substantial portion of urban traffic, often ranging from 10% to 30% or even higher. This includes the delivery of goods to businesses, commercial areas, and residences. In this light, efficient goods movement is critical for urban sustainability. Towards this direction, advanced fleet management systems can play a role for urban sustainability by optimizing routes, reducing emissions, and easing traffic congestion. Such systems promote data-driven planning, creating cleaner, efficient, and habitable cities. In the framework of the V-Agrifleet project, a smart fleet management system (Agri.Aware) that is based on a novel context-aware-based algorithm, has been developed. Context awareness can play a crucial role in such systems for promoting urban sustainability, in several ways; optimized routing

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

and fuel efficiency, reduced congestion, emission reduction, noise pollution mitigation, to name a few. By utilizing real-time data and promoting informed decision-making, the Agri.Aware system supports efficient and eco-friendlier logistics. The application has a typical three-tier architecture, as shown in Figure 1.

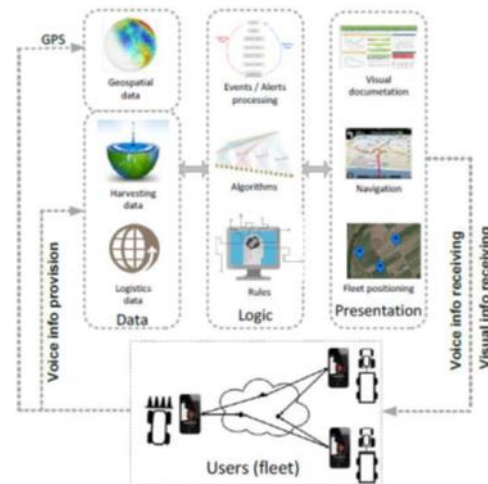

Figure 1: Architecture design of Agri.Aware

At the first level (Tier1), geospatial and logistics data are collected using sensors (GPS receivers and voice command receivers) placed in the fleet. Logistics data refers to information about transport operations, while geospatial data refers to navigation data about the exact locations and speeds of fleet units. At the second level (Tier 2), the above data is integrated in real-time on a centralized basis to support situational awareness and decision-support functions. At the third level (Tier 3), users can access through mobile devices the instructions and navigation data for routing (step-by-step directions), as well as the operating status of the other equipment units. Simulations results indicate the catalytic role of context-aware-based algorithms for sustainable urban mobility. This work has been co-financed by the European Regional Development Fund of the European Union and Greek national funds through the Operational Program Competitiveness, Entrepreneurship and Innovation, under the call Research – Create – Innovate (project acronym: V-Agrifleet; project code: T2EAK-03960).

ABSTRACT

Fleet management is essential for urban agriculture due to the unique challenges and requirements associated with operating a farming operation within an urban environment. Fleet management is important for various reasons, indicatively; resource optimization, cost control, route optimization, minimization of environmental impact, real-time tracking, scalability, regulatory compliance and data-driven decision making. More specifically, urban agriculture often involves managing various types of vehicles, such as trucks, maintenance vehicles, and agri-machinery. Effective fleet management ensures that all these diverse resources are used efficiently, minimizing downtime and reducing unnecessary expenses. Moreover, in urban areas, traffic congestion can be a significant challenge. Fleet management systems may assist plan optimal routes for vehicles, saving time and reducing fuel consumption. This is especially important for delivering fresh produce on time and maintaining the quality of products. Also, urban agriculture often operates on tight budgets. Fleet management allows for better control of expenses related to fuel, maintenance, and vehicle replacements. By identifying inefficiencies and implementing cost-saving measures, overall profitability can be improved. Apart from economic benefits, fleet management systems also target towards the minimization of environmental impact. With growing concerns about sustainability, efficient fleet management can help reduce the carbon footprint

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

of urban agriculture. By optimizing routes and reducing fuel consumption, greenhouse gas emissions are minimized. Real-time tracking of vehicles also provides visibility into their locations and activities. This is particularly useful for monitoring deliveries, ensuring they are on schedule, and addressing any issues that may arise during transit. In addition, urban agriculture operations need to adhere to various regulations, such as vehicle emissions standards and safety requirements. Fleet management solutions can support agri-producers to ensure that agri-machinery and vehicles are compliant with such regulations. Last but not least, as urban agriculture operations grow, managing an increasing number of vehicles and equipment becomes more complex. A robust fleet management system can accommodate scalability, allowing the operation to expand without compromising efficiency. For all aforementioned issues, fleet management is crucial for urban agriculture to streamline operations, enhance resource utilization, reduce costs, and ensure the timely delivery of fresh produce to urban consumers. It enables urban and peri-urban farmers to overcome the unique challenges posed by operating in densely populated areas, while maintaining sustainability and profitability. Towards this direction, the Agri.AWARE fleet management system has been developed. Agri.AWARE is a decentralized fleet management system that provides real-time information exchange between all involved individuals and machinery in agricultural production. The system can collaborate in heterogeneous fleets, regardless of manufacturer brand and specification of machinery. The tool supports operators by automatizing interaction with the system, allowing them to verbally interact with fleet users through voice commands. The Agri.AWARE system offers a cost-effective technology for agri-fleet management with voice commands and automatic decision-making, by providing operational status for each individual unit of the fleet, through the incorporation of the system's context awareness module. Agri.AWARE provides significant comparative advantages over existing fleet management technologies, since it is a sustainable solution (economically feasible and environmentally friendly) that holistically covers the needs of agricultural businesses and farmers for the optimal utilization of their equipment. This work has been co-financed by the European Regional Development Fund of the European Union and Greek national funds through the Operational Program Competitiveness, Entrepreneurship and Innovation, under the call Research – Create – Innovate (project acronym: V-Agrifleet; project code: T2EAK-03960).

ABSTRACT

For the purification of gases or to obtain new products, the absorption method is recommended for the removal of acidic impurities from gases. The chemical reaction absorption (chemisorption) can be carried out in a variety of solutions, including ammonia solution, aqueous amine solution, potassium carbonate solution, etc. Because of its benefits, such as affordability, ease of regeneration, nontoxicity, and non-corrosiveness, chemisorption in potassium carbonate solution with the addition of amines, as promoters, at a temperature of 70 to 80°C has been utilized more frequently. The presentation of the amine-supported post-combustion CO₂ capture in potassium carbonate solution. As amines were considered DEA, MDEA and TETA. The enhancement factor value (a ratio of the rate of CO₂ absorption in the presence of a chemical reaction to the rate of absorption in the absence of a reaction at same concentration driving force) was used to evaluate the efficacy of amines. Carbonate mass fractions between 0.1 and 0.4 and amine mass fractions between 0.018 and 0.04 were taken into account for simulation. The enhancement factor values obtained for the chemisorption in solution promoted with considered amines were values between 1.5 and 6.4, the higher for MDEA. Experimental data demonstrated that MDEA can be successfully used in the industrial applications - chemisorption processes, being more efficient, especially for high fluid flow rates. As results, we recommended potassium carbonate solution mass fraction 0.25 promoted with 0.04 MDEA.

ABSTRACT

The metal oxide SnO₂ is a typical wide band n-type semiconductor $E_g = 3.6$ eV at room temperature and is used in applications such as gas sensors, electrode materials and catalysts, in lithium ion batteries or solar cells. The purpose of this study is to obtain SnO₂ crystals from aqueous solutions, although SnO₂ nanostructures were prepared based on the sol-gel method with Tin (IV) chloride pentahydrate (SnCl₄•5H₂O). The samples were characterized by methods such as scanning electron microscopy (SEM), transmission electron microscopy TEM micrograph and EDS and X-Ray Diffraction (XRD). The samples were calcined at temperatures of 600 °C. The particle size of all samples was in the range of 28-92 nm calculated according to Scherrer equation. On the base of obtained materials properties the main application domains are presented and an deep analysis of these are provided.

ABSTRACT

The synthesis of metal oxides nanocomposite using biological methods is an emerging eco friendly and sustainable attractive. The current study focuses on the production of ZnO/Co₃O₄/MoO₃ nanocomposite (ZCM-NC) using the aqueous leave extracts of Ficus Moraceae. The leave extracts were found to be rich in phenols which were confirmed by the spectroscopy analysis thereby enhancing the biogenic synthesis of ZCM-NC. The prepared ZCM-NC was characterized by UV-vis absorption spectroscopy, Fourier transform infrared spectroscopy (FT-IR), X-ray diffraction (XRD), and scanning electron microscopy (SEM). The Scanning Electron Microscope with the Energy Dispersive X-ray studies were used for characterization that provides the size and the elemental composition of the synthesized ZCM-NC. The average size of the nanoparticles was found to be 30-50nm. The FTIR analysis played a pivotal role in displaying the important functional groups present in the ZCM-NC nanocomposite, which showed that the sample had strong absorbance in the range of 1600–1450 cm⁻¹. The electrochemical behavior performances of ZCM-NC/GCE were evaluated by cyclic voltammograms and EIS method. These results showed a ZCM-NC/GCE to be a promising electrode for electrochemical applications. The overall study reveals the biogenic synthesis of ZnO/Co₃O₄/MoO₃ nanocomposite using Ficus Moraceae, can be an alternative to chemical synthesis for the fabrication of effective electrodes.

ABSTRACT

This research delves into the dynamic amalgamation of Artificial Intelligence (AI) and Industry 5.0, with a central focus on catalyzing collaborative innovation in the pursuit of sustainable growth. The study undertakes a comprehensive exploration of the integration of AI within the Industry 5.0 framework, shedding light on the intricate interplay between human and machine collaboration. A critical facet of this investigation involves scrutinizing AI's transformative potential in augmenting human capacities, bolstering productivity, and germinating novel paradigms of business operations. The research deeply engages with the ethical dimensions and societal ramifications entailed by the infusion of AI within Industry 5.0 contexts. Drawing insights from real-world case studies and empirical evidence, the study delineates pivotal determinants for successful AI implementation, navigates prevailing challenges, and distills optimal strategies for harnessing AI's collaborative potency within the Industry 5.0 landscape. The culmination of this research manifests in a compendium of insights tailored for organizational and policymaking stakeholders, offering pragmatic recommendations to harness the symbiotic nexus of AI and Industry 5.0. Emphasis is laid on leveraging this synergy to propel collaborative innovation and engineer sustainable growth trajectories. While Industry 5.0 embodies ideals of human-centricity, socio-environmental sustainability, and resilience, a nuanced understanding of the mechanisms by which these ideals materialize remains incomplete. In essence, this study unfurls the potential of AI and Industry 5.0 synergy as a cornerstone for fostering collaborative innovation and steering the course toward sustainable growth in a rapidly evolving technological landscape.

ABSTRACT

Change in climate have a significant impact on various aspects of work, especially in the modern agricultural sector. Therefore, the Alam Tani Hidrofarm Kudus Sector faces new challenges in the production process. This study aims to describe and evaluate the effect of climate change on the growth of vegetable plants in Alam Tani Hidrofarm Kudus. The research method used is qualitative research with a case study approach. Data obtained through observation, in-depth interviews, and document collection. The result showed that climate change produces various impacts such as decreased productivity and quality in hydroponic lettuce plants. Factors such as temperature extremes, variations in rainfall, pests and fungi play a role. However, this study also identified various evaluations for increasing the productivity and quality of hydroponic lettuce. These solutions include implementing regular irrigation systems, using greenhouses, careful monitoring, using technology, and so on. This effort aims to deal with climate change both now and in the future.

ABSTRACT

This research was conducted due to the acceleration of globalization which has driven the rapid development of digital technology, providing opportunities for businesses to enter the digital marketing market. Therefore, UMKM Alam Tani Hydrofarm can increase their income through digital marketing strategies. The purpose of this research is to understand the role of digital marketing in increasing the income of UMKM Alam Tani Hydrofarm in Kudus. This study uses a qualitative descriptive approach, which aims to provide facts and data regarding the effect of digital marketing on the income of UMKM Alam Tani Hydrofarm. The results of this study indicate that digital marketing implemented by UMKM Alam Tani Hydrofarm has a significant impact. These UMKM actors can continue to develop their business while meeting consumer needs through digital marketing strategies. The transition to purchasing through digital marketing will also facilitate market expansion for UMKM. Current technological developments optimize the potential of UMKM and promote sustainable growth. Social media and e-commerce platforms are important means of increasing UMKM sales.

ABSTRACT

This study aims to determine the strengths, weaknesses, opportunities, and threats that affect Alam Tani Hidrofarm Kudus. The method used in this research is qualitative. The data used in this study is primary data by conducting interviews and observations at UMKM Alam Tani Hidrofarm Kudus. The results of this study indicate that the strengths possessed by Alam Tani Hidrofarm Kudus are reducing dependence on large agricultural land, products having good quality, appropriate market segmentation. These weaknesses include the unstable availability of hydroponic lettuce to meet vegetable demand, less variety of vegetable products, and the risk of technical failures in hydroponic systems that can disrupt production. While the opportunities that are owned are customer loyalty, high market demand for cleaner agricultural products, and a wider marketing network. The threats are the emergence of competition with agricultural products that may be cheaper, uncertainty in marketing, uncertain climate change, and unstable demand levels. Based on the results of the SWOT matrix analysis of internal factors (strengths and weaknesses) and external factors (opportunities and threats) of Alam Tani Hidrofarm Kudus, twelve alternative strategies were obtained consisting of the SO strategy, W-O strategy, S-T strategy and W-T strategy which can be implemented.

RESILIENCE AND PSYCHOLOGICAL WELLBEING AMONG YOGA-PRACTITIONERS AND NON PRACTITIONERS

Nishant

UG student, Sharda University

Priya Choudhary

Faculty, MIER College, Jammu & Kashmir

Hariom Sharma

Faculty, Sharda University

ABSTRACT

The term "yoga" is used to describe a collection of mental, physical, and spiritual practices that are thought to have originated in ancient India. It is believed that practicing yoga can bring harmony between the mind and body. Further, people who are resilient are not immune to experiencing distress or negative emotions, but they maintain optimism. To keep a confident viewpoint, expecting beneficial things and to exercise regularly for body and mind care are some of the ways to build the resilience. The psychological well-being has the potential elements like, happiness, perkiness, idealism, restraint, independence from dissatisfaction, nervousness and wretchedness (Tellegen, 1979; Sinha and Verma, 1992). The aims of the study were to investigate the difference between yoga practitioners and non-practitioners with regard to their resilience ability and psychological wellbeing. 30 yoga practitioners and 30 non-practitioners in the age range of 20-70 years gave their consent to participate in the research and responded on the resilience and psychological wellbeing scales. The significant differences were observed between resilience ability of yoga practitioners ($M=75.20$, $SD=12.38$) and non-practitioners ($M=61.28$, $SD=13.63$). Similar differences were also reported for psychological wellbeing among the two groups. Further the responses on six dimensions of the psychological wellbeing were also explored.

ABSTRACT

This work presents a novel approach for the preparation and characterization of 45S5 bioglass using rice husk ash (RHA) and eggshell ash (EGSA) as alternative resources at varying inclusions. The traditional method of producing bioglass involves the use of costly raw materials, such as silica and calcium carbonate. In this study, RHA and EGSA, which are abundant agricultural waste products, are utilized to synthesize 45S5 bioglass through a microwave energy-assisted melt-quenching approach. The obtained bioglasses were characterized for their structure, mechanical, morphology, and bioactivity. The results showed that all the developed bioglasses exhibited an amorphous broad hump structure. The morphology showed irregular morphology containing heterogeneous grains, rough and porous surface respectively essential for bone in-growth and cell infiltration while a cauliflower-like appearance of carbonate-hydroxyapatite was well pronounced on all the samples after immersion in simulated body fluid. The developed bioglasses also showed considerable micro-hardness and compressive strength to justify their use for biomedical applications.

ABSTRACT

With the aim of enhancing the structural performance of a mid-rise building exposed to exceptional seismic forces, passive base isolation systems have proven to be indispensable components of the architectural design. Among these solutions, the choice leans towards the FPS (Friction Pendulum System) base isolator. This type of friction pendulum support exhibits a highly nonlinear behaviour, limiting the transfer of shear forces through the isolation interface and consequently facilitating substantial energy dissipation. The objective of this study lies in the performance evaluation of the passive FPS system. To this end, an exhaustive parametric study was undertaken, taking into account a multitude of parameters including various seismic excitations of various natures. The results of this nonlinear dynamic analysis highlight exemplary performance of the FPS system. Indeed, a significant reduction in the structural responses, namely the relative displacements, as well as the relative accelerations of the top floor. Also, a notable reduction in inter-stories displacement was observed. This configuration allowed considerable energy dissipation, thus confirming the excellent performance of this system in order to optimize the structural robustness of a mid-rise building.

ABSTRACT

Statistical analysis of lifetime data is an important topic in reliability engineering, biomedical and social sciences and others. In this paper, a new one-parameter unit probability distribution called new unit rational sine distribution is proposed. It is more flexible than some existing well-known distribution due to its different shapes of the hazard function and probability density functions. We study some of its statistical properties. We obtain explicit expressions for moments, quantile function and order statistics. The method of maximum likelihood is used to estimate the model parameters. The parameters related to the proposed distribution are estimated using well known estimation methods. A numerical simulations study is conducted for reinforcement of the results. In the end, we considered three real data sets to illustrate the applicability of the proposed model. Statistical distributions are of immense importance to describe and predict the phenomenon of real world. In several logical analysis, the selection of a suitable statistical model is required. Though, a number of distributions have been developed, but there is always room for developing distributions, either having more flexibility in terms of shapes or fitting to the real world situations. Probability distributions are developed for solving different real world problems in different areas, some of the distributions are defined on the positive real line and some are defined on the whole real line.

ABSTRACT

Titanium oxide (TiO₂), known as titania, is an advanced ceramic material, considering it is produced from high purity synthetic raw materials. This material is found in three distinct polymorphic phases: rutile, anatase and brookite. Rutile is the most common and the most stable among them, being the material selected for use in the present research. The choice of titanium oxide was primarily due to the fact that it is a compound that has been standing out in several studies with regard to advanced ceramics. Furthermore, TiO₂ presents interesting characteristics for the formation of porous pieces, considering, above all, its high melting temperature, which implies a high sintering temperature, and consequently, the resistance and good stability of the materials produced. In this work, porous titania supports were

produced using the replica technique, in order to find a better porosity for later application of supports. Studies were carried out on the composition and rheology of titania slip from the variation of water, titania and additives contents; conformation, using polyurethane sponges as the material to be replicated with two different porosities (30 and 40 ppi); and drying and burning based on the variation of heating rates, burning temperature and levels, aiming at optimizing the process. So far, the composition and firing condition of the slip have been obtained for the production of porous titania pieces that ensure good mechanical resistance and a previously established large-scale production route. In addition, studies have showed the application of TiO_2 for the immobilization of microbial cells for fructooligosaccharides production.

ABSTRACT

The phase change of all-inorganic Cesium lead halide (CsPbI₃) thin film from yellow δ - phase to black γ/α - phase has been a topic of interest in the perovskite optoelectronics field. Here, the main focus is how to secure a black perovskite phase by avoiding a yellow one. In this work, we fabricated a self-doped CsPbI₃ thin film by incorporating an excess Cesium iodide (CsI) into the perovskite precursor solution. Then, we studied the effect of organic additives such as 1, 8-diiodooctane (DIO), 1-chloronaphthalene (CN), and 1, 8-octanedithiol (ODT) on the optical, structural, and morphological properties. Specifically, we employed the Flory–Huggins theory based on the oligomer level of additives' molar mass to elucidate the binary additive-solvent solution thermodynamics. Resultantly, we found that the miscibility of additive–solvent displaying an upper critical solution temperature (UCST) behavior is in the sequence CN: DMF > ODT: DMF > DIO: DMF, the trends of which could be similarly applied to DMSO. Finally, the self-doping strategy with additive engineering should help fabricate a black-phase perovskite although the mixed phases of δ -CsPbI₃, γ -CsPbI₃, and Cs₄PbI₆ were observed under ambient conditions. However, the results may provide insight into the stability of metastable-phase CsPbI₃ at room temperature.

APPLICATION OF ARTIFICIAL INTELLIGENCE IN DIFFERENT ASPECTS OF FUNDAMENTAL SCIENCES

Tinatin Mshvidobadze (ORCID: 0000-0003-3721-9252)

Professor Gori State University (Georgia)

Email: tinikomshvidobadze@gmail.com

ABSTRACT

Over the past two decades, artificial intelligence research has significantly improved the performance of both manufacturing and service systems. This paper presents the state-of-the-art in artificial intelligence in an integrated, concise manner to demonstrate expertise in the field. In particular, this paper provides a broad overview of recent developments in the field of artificial intelligence (AI) and its applications. Artificial intelligence (AI) and machine learning (ML) techniques are widely influencing many aspects of various fields, including science and technology, industry, and even our daily lives. This paper provides a comprehensive survey of the development and application of artificial intelligence in various aspects of the fundamental sciences, including information science, mathematics, medical science, materials science, geoscience, life science, physics, and chemistry. The challenges faced by each discipline of science and the potential of AI techniques to overcome these challenges are discussed in detail. Despite the widespread use of artificial intelligence in a wide range of applications, there are still ML security risks to data and ML models as attack targets during both the training and execution phases. First of all, since the performance of an ML system is highly dependent on the data used to train it, this input data is critical to the security of the ML system. Although many protection techniques have been proposed against these security threats, new attack models targeting ML systems are constantly emerging. Thus, it is necessary to address the ML security problem and develop robust ML systems that remain effective in the face of malicious attacks.

ABSTRACT

Water pollution by heavy metals cations such as Cd(II) and Hg(II) are likely to cause serious damage to human health due to their non-degradation behavior and high level of toxicity. In the last years, a lot of sorbent – based nanocarbonic materials for water decontamination through dispersive solid phase extraction (DSPE) have been developed and synthesized. This paper reports synthesis of a thiolated polystyrene - thiolated carbon nanohorns as novel matrix nanocomposite used as sorbent for Cd(II) and Hg(II) removal from waste water. These materials are robust, sensitive, stable in harsh environments. Furthermore, thiolated carbon nanohorns exhibit outstanding properties that recommend them for use as adsorbents in wastewater decontamination: uniform size, large surface area, selectivity. This matrix nanocomposite was designed according to HSAB theory (a hard base prefers to bind to hard acid, soft bases prefer to interact to soft acids, while a borderline bases tend to bind to borderline acids). From the HSAB concept point of view both Cd (II) and Hg(II) cations are classified as soft acids and it is easy to predict that these cations tend to interact with soft bases such as thiol group. Both materials were synthesized from polystyrene and pristine carbon nanohorns using H₂S, propanethiol (CH₃CH₂CH₂SH) or thiophene plasma functionalization. The synthesized materials were characterized by several techniques, including Raman spectroscopy, FTIR spectroscopy and X-ray photoelectron spectroscopy. The new matrix nanocomposite will be synthesized using a ultrasonical bath and an appropriate solvents.

ABSTRACT

This paper reports the design and manufacturing processes for a resistive ammonia sensor, employing binary nanocomposites consisting of fluorinated nanocarbon materials (CNHs-F) / polypyrrole (PPy), fluorinated onion-type nanocarbon materials (CNOs-F) / PPy, as well as CNHs-F/CNOs-F/PPy ternary nanocomposites as sensing layers, a dielectric substrate and electrodes. The functionalization of carbon nanohorns, as well as onion-type nanocarbon materials is achieved by F₂-N₂ plasma treatment. Polypyrrole can be used as a 5% aqueous dispersion (commercial product) or it can be synthesized in situ by a chemical polymerization reaction using pyrrole (monomer), FeCl₃ (oxidizing agent) and sodium p-toluenesulfonate (doping agent). Through the ad/absorption of ammonia molecules, electrons are transferred to the nanocarbon structure. Both CNHs-F and CNOs-F are p-type semiconductors, the number of holes decreases, therefore the resistance of the nanocarbon material increases proportionally. Polypyrrole is also a p-type semiconductor and by ad/absorption of ammonia molecules, the number of holes decreases, therefore the resistance of the polymer increases proportionally. The functionalization of carbon nanohorns and onion-type nanocarbon materials in F₂-N₂/ plasma has the advantage (by varying the exposure time as well as its power) that it can ensure an optimal C:F ratio. The dielectric substrate is glass, electrodes are deposited on the surface of the dielectric substrate by direct printing, sputtering, or evaporation. The electrodes can be made of the same material (gold, platinum) or of different materials. They can be linear or have an interdigitated configuration.

ABSTRACT

This paper reports the design and manufacturing processes for a surface acoustic wave (SAW) H₂S sensor, employing thiolated carbon nanohorns, (abbreviated as CNH-SH) as sensing layer, a quartz piezoelectric substrate and interdigital transducers. Pristine carbon nanohorns, purchased from Sigma Aldrich, are functionalized in H₂S/He plasma (volumetric ratio 60-40), with a plasma power of 30 W, at an exposure time of 5 minutes. The sensor used is of the "delay line" type, made on a quartz piezoelectric substrate. The sensor features a dual delay line to compensate for thermal drift. Thus, one delay line is covered with CNH-SH, the second delay line being the piezoelectric substrate itself (quartz without sensitive layer). To obtain a signal due exclusively to the chemical interaction CNH-SH - H₂S, the signal associated with the delay line without the sensitive layer can be subtracted from the signal of the delay line covered with CNH-SH (differential scheme). The use of functionalized nanohorn type films gives the sensor several significant advantages: superior mechanical properties; the presence of CNH-SH confers a high specific surface / volume ratio, affinity for H₂S molecules through van der Waals-type interactions ("mass loading"), as well as a variation in the resistance of the sensitive layer upon contact with them ("electric loading"); fast response of the sensor to variations in the H₂S concentration value; fast response of the sensor to variations in the H₂S concentration value; reversibility; detection at room temperature.

ABSTRACT

This paper reports the design and manufacturing processes for a resistive H₂S sensor, employing thiolated carbon nanooxions (abbreviated as CNO-SH) as sensing layer, a dielectric substrate and electrodes. CNOs are synthesized from nanodiamond, by thermal treatment at 1650°C, in a helium atmosphere. CNO-SH are synthesized through functionalization of pristine CNOs in H₂S/He plasma (volumetric ratio 70-30), with a plasma power of 40 W, at an exposure time of 4-6 minutes. The optimal degree of derivatization of the nanocarbonic materials, in order to obtain high sensitivities, can be modulated by varying the plasma power as well as the exposure time. The dielectric substrate is Kapton and can be between 50 microns and 5 millimeters thick. Electrodes can be deposited on the surface of the dielectric substrate by direct printing, sputtering or evaporation. The electrodes can be made of the same material (gold, chrome) or of different materials. They can be linear or have an interdigitated configuration. The use of CNO-SH as sensing layer films gives the sensor several significant advantages: superior mechanical properties; the presence of CNOs-SH confers a high specific surface / volume ratio, affinity for H₂S molecules through van der Waals type interactions as well as a variation in the resistance of the sensitive layer upon contact with them; fast response of the sensor to variations in the H₂S concentration value; detection over a wide temperature range; reversibility.

ABSTRACT

The most effective way to lower accidents is through vehicle-to-vehicle communication using Li-Fi technology. In this study, light-emitting diode bulbs are the main suggested application for Li-Fi technology, with data being delivered over the light spectrum as an optical wireless channel for signal propagation. With the use of this technology, traffic accidents can be averted and several lives can be saved. This project involves a variety of sensors, including an accelerometer, an ultrasonic sensor, and a speed sensor, and it transports the information gathered from these sensors across cars. Through this LI-FI, information can be sent between vehicles. Over LIFI, any kind of data, including text, audio, and video, can be exchanged. With lowest expense and greatest effectiveness, this concept can be put into practice. The widespread usage of LED-based lighting in modern life means that it can also be utilized for communication because of its benefits including quick switching, high power efficiency, and protection of human vision. In order to communicate data between automobiles in an eco-friendly manner, this project will use visible light, which is composed of white LEDs that transmit audio signals to the receiver. The future of VLC is promising, because it complements present RF communication by improving efficiency.

ABSTRACT

Magnesium and its alloys play important role in the fields of biomedical such as implant, due to its good bio degradability. However, accelerated corrosion rate in intro environment leads to implant failure by losing the mechanical integrity before complete restoration. In the investigation, hydroxyapatite (HA) coatings were created on the AZ91 magnesium alloy by utilising the electrical discharge coating technique. During the coating of magnesium alloy, different factors such as discharge current, pulse on time and pulse off time were controlled. Coating composition, surface topography and degradation in simulated body fluid (SBF) of the electrical discharge coated specimens were evaluated. It is revealed that the coating layer thickness increased to 82 μm , as increase in current and pulse on time, whereas, when increase the pulse off time. Electrochemical tests show that the E_{corr} of Mg substrate positively shifted about 300~500 mV and i_{corr} lowers more than 100 times after electrical discharge coating. Though, the HA coatings formed in the higher current and pulse on time indicate an increasing worse corrosion resistance compared with that of the base AZ91 magnesium alloy, which is possibly attributed to the increasing amorphous components caused by HA involvement.

ABSTRACT

*In this study, we explored the quantitative correlation between the effectiveness against non-small cell lung cancer (NSCLC) and the molecular configuration of a set of 38 derivatives based on cyclohexane-1,3-dione-dimidone. To achieve this objective, we employed molecular characteristics determined through DFT-B3LYP/6-31G calculations, along with topological and physicochemical analysis. The outcomes of the assessments for the QSAR models developed in this research using MLR and MNLR techniques reveal the substantial predictive capacity of these models. For the linear model, the coefficients of determination were ($R^2 = 0.913$; $R^2_{cv} = 0.85$; $R^2_{test} = 0.934$), and for the nonlinear model, they were ($R^2 = 0.991$; $R^2_{cv} = 0.82$; $R^2_{test} = 0.997$). Leveraging predictions stemming from the QSAR model, novel molecular structures were conceptualized. Their efficacy against NSCLC was gauged, and the principal interactions between these molecules and the human c-Met protein were anticipated. The amalgamation of forecasts from the QSAR models, molecular docking, and the evaluation of *in silico* ADMET properties indicated that one out of the sixteen newly conceived molecules holds potential as a prospective drug for NSCLC.*

ABSTRACT

Hoverflies play a key role in plant pollination at higher altitudes. With increasing concerns about the decline of potential pollinator populations, a 'sampling monitoring scheme' needs to be developed for the evaluation of the changes in the populations of these key high-altitude pollinators. We sampled hoverfly communities along an altitudinal gradient (1,800-2,800 m.a.s.l.) in a Himalayan mountainous region of India. Yellow pan traps were established at five sampling spots, with 200m difference in altitude between each point. A total of 42 species of hoverflies were collected during one sampling year. Hoverfly populations showed a pronounced change along the increasing altitude with a unimodal distributional pattern of species richness and abundance being observed with a peak at middle altitude (2200 m). The present study poses important conservational consequences. During this study some rare species, and new country records were observed; this study represents important baseline data that would be of immense value in planing a 'sampling monitoring scheme' aimed at assessing the effects of climate change on pollinator populations in these fragile Himalayan habitats.

ABSTRACT

Environmental concerns have piqued people's interest in recent decades due to their enormous influence on human existence. Because of their significant carcinogenic and mutagenic effects, dyes in wastewater can create major difficulties for humans and other creatures. Photocatalysis has evolved as an alternative dye wastewater treatment method in recent years because of its nontoxicity, excellent selectivity, and long-term stability. The semiconductor TiO_2 used as a photocatalyst and its visible light activity appears to be improved by forming a heterojunction with other narrow band gap semiconductors. Because of the close interfacial connection and adequate conduction and valence band levels, $\text{g-C}_3\text{N}_4$ may form a heterojunction with TiO_2 that inhibits recombination of photogenerated electron-hole pairs and considerably enhance photocatalytic activity of TiO_2 under visible light. The microstructure and interface properties of the $\text{g-C}_3\text{N}_4/\text{TiO}_2$ composite are investigated using XRD, SEM, HRTEM, FTIR, and UV-vis DRS. The $\text{g-C}_3\text{N}_4/\text{TiO}_2$ hybrid photocatalysts demonstrated stable photocatalytic activity, indicating that it is a viable material for dye photodegradation in wastewater.

ABSTRACT

PZT ceramics of general formulation $Pb(Zr_xTi_{1-x})O_3$ are widely used in many technological fields due to their dielectric and electromechanical properties. It is possible to modulate these properties and obtain specific characteristics for precise applications by performing cationic and/or anionic substitutions in the crystalline network of the PZT base material of the perovskite structure. $Pb_{1-x}Sr_x(Zr_{0.52}Ti_{0.43}Al_{0.025}Sb_{0.025})O_{3-2x}F_{2x}$ ceramics were fabricated by conventional solid-state reaction. The effect of Ba, F co-doping on structure and dielectric properties of PZT ceramics were studied. The results show that the $Pb_{1-x}Sr_x(Zr_{0.52}Ti_{0.43}Al_{0.025}Sb_{0.025})O_{3-2x}F_{2x}$ ceramics possess Rhombohedral and tetragonal phases for all samples which indicating that we are near the morphotropic phase boundary. The nature of the phases obtained was verified by powder X-Ray Diffraction (PXRD). Cold-pressed pellets of 13 mm diameter and about 1 mm thickness were elaborated by compacting the calcined powders then sintered at temperatures between 1150 and 1270 °C. Depending upon the sintering temperature, the density of ceramics has been changed. The texture (porosity and grain size) of the sintered material was observed by Scanning Electron Microscopy (SEM). The room temperature transmittance of $Pb_{1-x}Sr_x(Zr_{0.52}Ti_{0.43}Al_{0.025}Sb_{0.025})O_{3-2x}F_{2x}$ has been investigated by Fourier Transform Infrared Spectroscopy (FTIR) in the range of 400–4000 cm^{-1} .

ABSTRACT

In this study, solid-state synthesis was used to create the SrCO₃ modified Lead Zirconate Titanate ceramic with Zr/Ti = 43/52 near the morphotropic phase boundary (MPB), whose chemical formula is Pb_{1-x}Sr_x (Zr_{0.43}Ti_{0.52}) (Al_{0.5}Sb_{0.5})_{0.05}O₃. Tetragonal and Rhombohedral symmetry phases coexisted in the system, according to the powder x-ray diffraction (PXR) analysis of phase formation. A microstructural analysis using a scanning electron microscope (SEM) revealed a non-uniform distribution of large grains over the sample surface as well as the presence of a few micro-sized pores. We studied frequency and temperature dependencies of impedance and electric modulus in a wide frequency range (0.1kHz-1MHz) at different measuring temperatures (300-700K). The results showed the contributions of grains to the material's capacitive and resistive properties. As seen from the Nyquist graph, grains contribute to the resistance and capacitance of the complex impedance plots. The Nyquist plot was applied to an electrical circuit that was equivalent. At all temperatures, precise fitting steps were used to determine the grain resistance and capacitance values. It is assumed that the substitution of Sr²⁺ ions at the Pb-site causes an increase in the dielectric constant at higher temperatures.

ABSTRACT

Artificial Intelligence has become increasingly effective in image recognition. Image recognition is a digital image or video technique that identifies and detects an object. However, images taken in an uncontrolled environment are often of low quality, which can lead to misclassification of such images, this study focuses on building an image recognition model that can reliably classify images independent of image quality. To achieve this, Python programming language was adopted in building a Convolutional Neural Network (CNN) and Artificial Neural Network (ANN) models based on TensorFlow, a robust Deep Learning framework, and Keras, a high-level, user friendly API that facilitates the development of the Deep Neural Networks. The CIFAR-10 dataset was adopted for this study and the model recognition with CNN yielded an accuracy of 79% which is a significant improvement over ANN with 50% accuracy. The study therefore concludes that CNN is best for image classification in an uncontrolled environment and due to the fact that max pooling while reducing the dimensions of images but preserving the features, computation complexity in CNN is far less compared to ANN.

ABSTRACT

Materials informatics (MI) is a branch of materials science that utilizes high-throughput computation to analyze large databases of materials properties to gain unique insights for device application. Application of machine learning (ML), artificial intelligence (AI) and Data science are now a common place in materials research. Materials scientists are constantly striving to advance their ability to understand, predict, and improve materials properties. Due to the high cost of traditional trial-and-error methods in materials research, material scientists have increasingly relied on data analysis, simulation and modeling to understand and predict materials properties a priori. This study investigates the prospects and challenges of materials science research in Africa and the role of machine learning and computational materials science towards the development of the materials research focus of Africa. To achieve this, the study reviewed the concept and challenges of materials science research in Africa, materials informatics alongside its prospects and challenges through the use of secondary data from relevant literatures, lecture notes and research experience, reports and involvement. This background is of essence to African researchers given the absence/inadequacy of research funding for consumables, equipment and laboratories in Africa, hence when equipped with sufficient computational resources, African materials scientist will have good opportunity to compete with the leading groups in the world and contribute to the development of science in the region. This study provides valuable reference in science, engineering and technology education employed in training and development programs towards advancing materials science research in Africa.

ABSTRACT

Nigeria is blessed with abundant graphite deposits and raw materials for Pencil production but unfortunately has not been able to harness these potentials for its production. This work is aimed at Designing and developing a laboratory scale Pencil Lead Extrusion Die. The Die was designed using Solid-works e-drawing software version 2013 and developed. It was designed with four different components that can be easily assembled together this include; Die-jig, Die-tube, Rammer and Die-nozzle. HB and 6H grades Pencil Leads of 3mm diameter each were produced using the die with a local graphite concentrate. The produced Pencil Leads were heat treated in a Furnace to impart the desired strength. Local Pencil Stock treated with wax to improve it machining and sharpening characteristics was used. Micro-Hardness test was carried out on both the pencil Lead and the stock using Vickers Micro Hardness Tester. The hardness values of the produced HB and 6H grade Pencils were found to be 35.9HV and 46.8HV which are in agreement with 31.2HV and 42.5HV for standard HB

and 6H grades respectively. Kapok local Pencil stock was used successfully as a Pencil case due to its good machining and sharpening characteristics with straight and well aligned grains; it also sharpens without splinters. Writability and glide test established that the Pencil glides smoothly with good writability compared with standard HB Pencil Leads.

ABSTRACT

The main objective of this study is to develop a model for predicting the kinetics of powder-pack boronizing of 4Cr5MoSiV1 steel in the temperature range of 1133 to 1253 K, with treatment durations ranging from 1 to 8 hours. The focus lies on accurately estimating the thicknesses of the resulting boride layers. The proposed kinetic model employs dimensional analysis to simulate the boronizing process for 4Cr5MoSiV1 steel. Subsequently, the experimentally obtained layers' thicknesses are compared to the predicted values. Furthermore, the study demonstrates the effective use of dimensional analysis in the boride layers' thicknesses under the specified boriding parameters.

ABSTRACT

In this comparative research, the marriage-related practices of Sumerian, Babylonian, Persian, Egyptian, Greek, Roman, Chinese, European, African, and American cultures are examined in relation to one another. The study looks at how marriage has contributed to and maintained social order, as well as the gender roles it practices and the historical and cultural settings that have created them. It indicates that although many cultures regarded marriage as a sacred institution, the specific customs and rites varied greatly. The analysis of secondary sources, academic analysis, and thematic analysis of marriage customs in the chosen civilizations are all used in this study's qualitative methodology. While arranged marriages were common in Sumerian and Babylonian cultures, Greek and Roman society placed a great value on things like dowries and divorce rules. The study also highlights how variable gender roles and expectations are in marriage, with some cultures valuing marriages with more equal partners while others place greater emphasis on the submissive position of women. This study underscores the importance of understanding earlier cultural practices to better understand the origins of our current society and gives insight on the nuanced and various views that ancient civilizations had on the institution of marriage.

ABSTRACT

Case method is a type of learning where a real-life situation or a situation that resembles real-life presented to learners who attempt to create a solution to the situation. A common scenario at workplace especially in marketing and sale department is for workers to take advantage of the customers by providing false information such as the benefits of a product and its price in order to increase their sales. In light of such case, it is necessary for coworkers who notice this type of misconduct to take proactive actions to prevent this scenario. This team presented a solution where closed-circuit television (CCTV) cameras are installed in designated areas to deter workers from committing anything that violates work ethics. The team decided a vote should be done where the workers in the company should be able to choose either for the offender to stay or be laid off. Preventative measures must also be taken by the company in order to prevent such case from occurring in the future. This includes regular meetings and meeting out fines on those that break rules.

ABSTRACT

One of the most important applications of photonic crystal is biosensor. The present research proposes slab silicon based on two-dimensional (2D) photonic crystal biosensor. In this paper, machine learning techniques are used to compute optical properties including quality factor and sensitivity for the proposed structure. These machine learning algorithms, based on an artificial neural network, can be able to make accurate predictions of above-mentioned optical properties for parameter including radius of 0.3-0.6 μm , pitch of 1-3 μm , and number of holes 16. The simulation software is Lumerical Mode to investigate the quality factor and sensitivity of the proposed biosensor.

ABSTRACT

High strength-to-weight ratio and good energy absorbing of composite sandwich plates have been caused that they are widely used in various engineering applications such as building structures and aerospace. Graphene Nano sheets/Epoxy Nano-composite is used as face sheets of sandwich structures to enhance these applicable structures and increase their strength and stiffness. In this research, free vibration of annular sandwich plates with functionally graded grapheme Nano-composite face sheets is studied. ANSYS standard code is used for three-dimensional finite element method constructing and analyzing of the sandwich plates with a flexible soft core and two functionally graded grapheme Nano-composite face sheets. Natural frequencies of the annular sandwich plates are presented and the effects of geometrical parameters, materials properties and boundary conditions of the sandwich plate are inspected. Comparison of the present results in special case for vibration with those of the accurate annular plate theories confirms the accuracy of the proposed finite element model. According to the obtained results, the natural frequencies of the annular sandwich plate with different boundary conditions are improved by employing the functionally graded grapheme Nano-composite face sheets. Results show that the natural frequencies increase with increase in thickness ratio and radius ratio. Also, obtained results indicated that the boundary conditions affect on behavior of sandwich plates, significantly and plates with clamped boundary conditions have the largest natural frequencies.

ABSTRACT

Air pollution poses a significant public health concern, often impacting specific population groups on a recurring basis. Over the past few decades, research has established a correlation between environmental degradation and human health, particularly in relation to the presence of pollutants in the air. To illustrate this, we conducted a study in which we measured the levels of fine particulate matter, specifically PM_{2.5} and PM₁₀, using the SDS011 pollution sensor. This sensor proved highly accurate in providing real-time measurements in the Sonatrach GPLI region. However, it did not provide us with information regarding the composition and emission rates of toxic gases regularly released by the nearby refineries. Consequently, we require additional sensor types capable of effectively monitoring these hazardous pollutants.

ABSTRACT

The problem related to the behavior of a conductive liquid in the presence of a magnetic field and a temperature gradient is raised in several areas of industry. In this work, we numerically studied the magnetohydrodynamics of the turbulent natural convection of nanofluids (Water + Ag / TiO₂ / Cu) in a differentially heated rectangular cavity. To predict the turbulent behavior of the flow, we used the standard $\kappa - \varepsilon$ turbulence model. The governing equations of the physical problem are discretized by the finite volume method using the power law interpolation scheme to approximate the values of the functions of the various variables at the interfaces of the control volumes with respect to the nodes of the grid. The study focuses on the effect of physical parameters such as the Rayleigh number ($10^7 \leq Ra \leq 10^{10}$), the two-dimensional orientation of the magnetic field ($0 \leq \gamma < 2\pi$), the Hartmann number ($0 \leq Ha \leq 300$) and the volume fraction in nanoparticles ($0\% \leq \varphi \leq 6\%$). The results obtained show that the Rayleigh and Hartmann numbers have a considerable effect on the hydrodynamic and thermal fields. Indeed, the addition of the nanoparticles changes the thermal and electrical performance of the mixture, which significantly affects the convective heat exchange within the enclosure in the presence of a magnetic field. In addition, the orientation angle of this field strongly affects the hydrodynamic and thermal flow in nanofluids.

ABSTRACT

Inverters play a crucial role in the world of renewable energy and batteries. Acting as the bridge between these sources of power and our everyday devices, inverters convert the direct current (DC) produced by renewable energy sources, such as solar panels or wind turbines, into alternating current (AC). Unfortunately, the operation of these converters often leads to the presence of unwanted harmonic distortion caused by the ON and OFF switching of IGBTs or MOSFETs. To address this issue, various modulation schemes are implemented to efficiently control the on-off switching and effectively minimize these undesirable harmonics. When it comes to modulation methods in the field of DC-AC inverters, Sinusoidal Pulse-Width Modulation (SPWM) and Selective Harmonics Elimination Pulse-Width Modulation (SHE-PWM) are widely recognized. The common parameters between two techniques are modulation index and the number of pulses. The evaluation of results obtained from both techniques relies on the criterion of achieving the lowest possible Total Harmonic Distortion (THD). The THD is a measurement of the harmonic distortion presents in a signal and is defined as the ratio of the root mean square of the harmonic content, including the harmonic components. Maintaining a low level of THD in inverters is important in order to maintain the desired operation. This paper presents a comparative analysis of Sinusoidal Pulse-Width Modulation (SPWM) and Selective Harmonics Elimination Pulse-Width Modulation (SHE-PWM) implemented in a Single-Phase Inverter. In order to evaluate and validate the effectiveness of these techniques, simulation results are obtained using the MATLAB-SIMULINK software.

ABSTRACT

Plastics play an important role in our daily life due to their ease of installation and relatively low production costs. Currently, polymers are materials of great importance in our modern societies. The Chlorinated PVC is one of the main polymers currently used. is obtained by post-chlorination of the PVC. It has been used in a variety of processes and industries for over 30 years. The effect of adding more chlorine to the PVC molecule is to raise the glass transition temperature (T_g) of the base resin from 95 to the 115–135 °C range. The main objective of this study is to characterize the mechanical behavior of chlorinated polyvinyl chloride (CVPC) at different degrees of temperature from -10°C to 90°C based on simple experimental tensile tests. The experimental results obtained allowed us to follow the evolution of the damage and to quantify it. Subsequently, we were able to determine three stages of damage which make it possible to initially predict the initiation of the damage and then the instant of the critical damage and therefore be able to intervene in time for predictive maintenance of the system.

Email: bjp.ece@rmkec.ac.in

Shalini R

Electronics and Communication Engineering, RMK Engineering College, Tamil Nadu, India

Email: shal21441.ec@rmkec.ac.in

ABSTRACT

With the advancement of technology, professionals are constantly seeking novel electronic equipment to aid in the identification of anomalies within the body. The development of information and communication technology in recent years has resulted in the establishment of the Internet of Things (IoT). In the world, skin illnesses are the most prevalent due to inherited and environmental causes. People frequently disregard the early effects of dermatitis. In the current approach, skin diseases are discovered through the biopsy process, which is then examined and treated manually by doctors. We propose a hybrid approach that combines Internet of Things (IoT) and machine learning approaches in order to get beyond this manual scrutiny and deliver promising results quickly. For this type of technique, the input is fed as the image, or histopathological from texture, colour, and eventually form which are extracted and supplied to Convolution Neural Network (CNN). This CNN network aids in diagnosing and classifying the disease. Using machine learning and image processing, this research suggests a way for detecting skin diseases. Once the skin disease is detected, the food products that should be avoided are listed in the application. So that the escalation of the disease could be avoided. The patient's area code must then be input in the appropriate column, and using that information, a list of dermatologists nearby will be displayed. By using this strategy, it is simple and quick for one to locate the right hospital. As a result, it takes less time to search the hospital. Thus, this suggested application may be a simple approach to diagnose the sickness and aid in helping individuals find appropriate solutions to the specific disease.

ABSTRACT

Customer satisfaction in e-ticketing is a complex phenomenon that is shaped by a wide range of variables including customer technical support, infrastructure, data security and user-friendliness. Understanding these issues is critical for organizations to create e-ticketing systems that initially meet customer needs and generate a high level of satisfaction. The existing tricycle ticketing system for Federal Polytechnic is manual such that booking of tricycles can only be done in designated areas around the school. This system involves time wasting in booking in which a passenger will either have to trek to the areas where tricycles are usually parked with no assurance of getting a tricycle there. The proposed system is to provide an easier method of transportation and an online system in the Federal Polytechnic Bida, as such an E-ticketing system is designed using React Native, an open-source JavaScript framework used to build apps for multiple platforms including iOS, Android, and web applications and MongoDB as its database. With the new system, passengers can check the availability of seats and reserve a seat online. The challenges posed by the manual method are resolved by this new one and allowing users to avoid squabbling over available seats. It is an achievement in our institution to this type of system of tricycle operation.

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

technology confirmed that human GlyT1 activity is strongly and significantly affected by constitutional, geometrical, physicochemical and topological descriptors. ADME-Tox in-silico pharmacokinetics revealed that L28 and L30 ligands were predicted as non-toxic inhibitors with a good ADME profile and the highest probability to penetrate the central nervous system (CNS). Molecular docking results indicated that the predicted inhibitors block GlyT1, reacting specifically with Phe319, Phe325, Tyr123, Tyr 124, Arg52, Asp475, Ala117, Ala479, Ile116 and Ile483 amino acids of the dopamine transporter (DAT) membrane protein. These results were qualified and strengthened using molecular dynamics (MD) study, which affirmed that the established intermolecular interactions for (L28, L30–DAT protein) complexes remain perfectly stable along 50 ns of MD simulation time. Therefore, they could be strongly recommended as therapeutics in medicine to improve memory performance.

ABSTRACT

*Using seaweed extracts to reduce silver metal resulted in a more environmentally friendly silver nanoparticle synthesis. Three seaweed species from the green, brown, and red classes were chosen. The analyses revealed that seaweeds have potential in terms of the presence of functional moiety involved in bio reduction and the stability of silver nanoparticles (AgNPs). The absorption peaks of these nanoparticles in the 400-450 nm range were measured using a UV-Visible spectrophotometer. After the incubation period, the colour intensity increased, and the incubation period for making silver nanoparticles with brown and red seaweeds was 48 hours, whereas the incubation period for green seaweeds was 98 hours. Scanning electron microscopy (SEM) and the Fourier transform infrared (FTIR) technique were used for additional analysis. Silver nanoconjugates were used in antibacterial research. Which demonstrated good antibacterial activity against *S. aureus* and *E. coli*, two bacteria that can cause food poisoning. This synthesis contained no harmful processes, which is good for the environment. The silver nanoconjugates have the potential to be used in drug development, medical devices, water purification, microbial activity, and agriculture.*

Keywords: AgNPs, UV-Visible Spectrophotometer, Fourier Transform Infrared (FTIR), Scanning Electron Microscopy (SEM), Silver Nanoconjugates.

ABSTRACT

$\text{Bi}_2\text{FeCrO}_6$ thin films were grown on Nb-doped $\text{SrTiO}_3(001)$ by pulsed laser deposition with thicknesses of 7.5, 49, 98 nm. X-ray diffraction measurements demonstrate that the deposited films are epitaxial with a preferential growth orientation perpendicular to the (003) plane. The Williamson-Hall equation indicates that microstrain decreases while the crystalline size increases with increasing film thickness, i.e. the increase in relaxation. The UV-Visible measurements were carried out at room temperature.

Keywords: $\text{Bi}_2\text{FeCrO}_6$, Structural Properties, Double Perovskite.

ABSTRACT

The structural and dielectric properties of TiO₂ samples doped with rare-earth have been synthesized using solid-state method. The XRD data, all of the samples have a tetragonal anatase structure, no change in crystal structure of TiO₂ after doping with different rare-earth concentration, which indicates the single-phase polycrystalline material. The dielectric properties were obtained and associated with the rare-earth content. The a.c. analysis shows that the dielectric constant ϵ and dielectric loss $\tan \delta$ decrease with the increase in Temperature. The dielectric properties decrease with the rare-earth concentration. This behavior has been explained on the basis of Maxwell–Wagner interfacial model.

ABSTRACT

Lattice Boltzmann Method is a dynamic method that simulates the macroscopic behavior of fluids by using a simple mesoscopic model. It inherited the main principles of Lattice Gas Automaton (LGA) and made improvements. From lattice gas automaton, it is possible to derive the macroscopic Navier-Stokes equations. Lattice Boltzmann Method (LBM). Three-dimensional is proposed for the first time for fluid flow and heat transfer simulation. Three types of cubic natural convection problems are solved with proposed method at various Rayleigh numbers.

ABSTRACT

The hydraulic ram pump is a mechanism that can raise water to higher levels without requiring external energy input. An evaluation was performed on a hydraulic ram pump in order to confirm and assess the variables that boost its effectiveness. The pump was constructed using materials that were easily obtainable in the region, and the analysis was conducted in Ahmadu Bello University's Hydraulics laboratory of the Department of Water Resources and Environmental Engineering in Zaria, Nigeria. The investigation demonstrated that for a ½" delivery pipe and ¾" supply pipe, the Head of the supply tank 1.93m produced a flow rate at supply tank 33.13L/min, whereas, for a 3.5m Head of the delivery tank, the

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

Delivery flow rate was 4.09L/min with a pump efficiency of 22.38%. The ideal setting was determined to be the waste valve located at the end of the tube, with peak and minimum efficiency values of 24.13 and 17.03 respectively, and R^2 values of 0.69 (delivery valve) and 0.97 (waste valve). The study outcomes indicated an inverse correlation between the Head of the delivery tank and the Delivery flow rate at the storage tank outlet and that smaller diameter pipes for delivery in combination with larger diameter supply pipes resulted in higher Delivery flow rate values.

**EFFECTS OF FIRE OUTBREAKS IN ECOSYSTEMS ON HABITATS AND
DISTRIBUTION PATTERNS OF TERRESTRIAL MAMMALS IN IRAN**

Nafiseh Faghieh Sabzevari (ORCID: 0000-0003-4351-3714)

Ferdowsi University of Mashhad, Faculty of Natural Resources and Environment, Department
of Environment, Mashhad, Iran

Email: na.faghihsabzevari@mail.um.ac.ir

ABSTRACT

Natural fire regimes help maintain healthy ecosystems, though anthropogenic climate change and land-use change has altered wildfire patterns worldwide, posing a threat to biodiversity. Fire outbreaks in ecosystems can directly or indirectly affect the quality and extent of desirable habitats for species, population size, species distribution patterns, disease outbreaks, and mortality rate of species. The magnitude of this effect highly depends on the biological and ecological characteristics of species as well as the spatial and temporal scales of fires. Thus, management plans should include information about identifying fire-susceptible habitats and post-fire habitat changes. Species distribution models (SDMs) are among the methods that can be employed to provide some of the information above, including predicting critical habitats, connectivity, and landscape susceptibility. Consequently, the present research (a review article) explores the studies conducted on the impact of human-caused fires, and anthropogenic climate change on the distribution patterns of terrestrial mammal species. and changes in their habitats using modeling techniques. According to the findings, scant research has been performed in Iran on the effects of fires as one of the main drivers of species distribution, especially terrestrial mammals. Relevant studies have mainly focused on the impacts of fires on forest vegetation cover. while, fire outbreaks in fire-prone ecosystems cause changes in species distribution patterns, whose consequences include the reduced efficiency of conservation network. Therefore, further research is required to be carried out on the effects of habitat fires on the distribution patterns of mammal species and to identify fire-prone habitats in Iran.

**APPLICATION OF PROLINE AS PRE-SOWING SEED TREATMENT ON OKRA
UNDER WATER DEFICIT CONDITIONS**

Arshia Zia

Department of Botany, University of Agriculture, Faisalabad

ABSTRACT

Okra (Abelmoschus esculentus L.) is a flowering plant belongs to Malvaceae family and it is one of the most well-known and frequently used species. A pot experiment was carried out at Old Botanical Garden, University of Agriculture, Faisalabad, to examine the effect of proline as pre-sowing seed treatment on okra. In the Pots, two okra (Abelmoschus esculentus L.) varieties i.e. Sabzpari and Roshni were used for sowing. There were 3 replicates of each treatment. Five kg soil was used in each pot. Okra seeds were pre-soaked in three levels of proline i.e. H₂O, 10 and 20 mM for 12 h to investigate the effect of proline. Two levels of drought (normal watering as control and 60% Field Capacity) were maintained. Experimental layout was completely randomized design (CRD). After 15 days maintaining of drought growth and biochemical related attributes were studied. Results indicated that morphological parameters (shoot length, plant length, shoot fresh and dry weight, root fresh and dry weight, plant fresh and dry weight) were decreased under drought stress. Proline implementation overcame drought effects by increasing these morphological parameters. Antioxidant activities i.e. catalase (CAT), superoxide dismutase (SOD) and peroxidase (POD) also enhanced under drought by the implementation of proline. While reactive oxygen species malondialdehyde (MDA) and hydrogen peroxide (H₂O₂) contents decreased by the application of proline. Mineral shoot ions (Na⁺, K⁺, Ca²⁺) showed positive role in okra plant by the application of proline. Roshni showed better performance than Sabzpari. Best response was recorded at 20 mM proline level.

ABSTRACT

This study was carried out in the vulnerable and arid climatic regions of the study area, namely Hala Tehsil of Matiari, Sindh, which has experienced unpredictable droughts and extreme floods in recent decades. Thus, this study focuses to on explaining and visualizing variations in groundwater recharge and groundwater quality along an ephemeral stream that has been modified by flood spreading via an electrical resistivity survey (ERS) and GIS 10.8 of the research area. The ERS was conducted using the ABEM Terrameter SAS 1000 at 16 locations. ABEM Terrameter SAS 1000 has been used to record vertical electric prospecting using a Schlumberger array. The two outer electrodes A and B are used for the current, and the resulting potential difference is measured across the two inner electrodes M and N. The distance of the current and potential electrodes from the center, which are referred to as AB/2 and MN/2, respectively, characterizes the array. MN/2 is always kept sufficiently small relative to AB/2. The results showed the overall dominant quality of regional groundwater up to 60 m deep as 25% fresh, 50% marginal fresh, and the rest as saline water. On the other hand, the water quality of groundwater from 120 m to the depth of 300 m was found to range from marginal water to high salt water. The quantity of good-quality groundwater has also been estimated with ArcGIS interpolation techniques. In addition, groundwater samples were also collected from 16 deep wells located at different distances, and groundwater quality was

TeMALab

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

followed via Total Dissolved Solids (TDS), Electrical Conductivity (EC), and pH measurements. The results show a significant impact of flood spreading on the groundwater table and groundwater salinity variation. The groundwater table decreased in all study wells.

ABSTRACT

The quadruple tank process has been widely used in control literature to illustrate many concepts in multivariable control. In this context, this paper deals with the intelligent control of a quadruple tank process. The objective of the current study is to design and to compare between fuzzy controller and adaptive neuro fuzzy inference system (ANFIS) controller for a multivariable four-tank process. Simulation results confirm the effectiveness of the proposed control strategies and highlight the superiority of the ANFIS controller in both minimum phase and non-minimum phase operating conditions.

ABSTRACT

This paper will investigate the efficiency of an optimal fuzzy logic controller (FLC) for a decentralized source which is established on the basis of a solid oxide fuel cell (SOFC) that is linked to the electrical network through a voltage inverter and a boost converter. To serve the purpose of this research, a Biogeography Based Optimization (BBO) is applied in order to adjust the parameters of the membership functions (the centers and the widths of the gaussian membership functions in inputs and output) for the purpose of improving the efficacy of traditional fuzzy logic controller. The given control methods have proved to be effective drawing from simulation results, and show that fuzzy logic controller tuned by biogeography based optimization is better and more robust than the traditional fuzzy logic controller for decentralized source based on a SOFC.

RENEWABLE ENERGY

Kevin Budlla

Student in Turgut Ozal Durres College

Email: kevinbudlla@gmail.com

ABSTRACT

In this paper I will show the types of renewable energy (green energy). It will show the history and statistics of these energies at the service of consumers in Albania. The methodology used is that of the analysis of data from INSTAT Albania as well as state institutions for renewable resources and the ratio of clean to impure energy. In this paper I will demonstrate the calculation of energy productivity. After theoretically describing the production of hydro energy, solar energy and wind energy, I will finish the work in an example mock-up where these energies are included. For the construction of the sample carpet, the laws of physics will help me and the materials used will be recyclable materials at no cost. At the end of the paper, it will show the sources of renewable energy still unused in Albania. This will be a project that will continue to improve and automate the distribution of these energies to the consumer.

Indonesia

ABSTRACT

This research intends to explain the study of travel tourism and tourism industry in Indonesia. The research method uses a type of qualitative research with an analytic descriptive approach. This study concluded that tourism is currently an important industrial sector for a country because tourism also contributes to improving a country's economy. After all, it is one of the sources that contribute to income for the country including Indonesia. Indonesia has a variety of tourism potentials spread across various regions and each has its advantages so that the tourism business or industry is becoming increasingly diverse according to the needs of tourist places in general, such as souvenirs, lodging, places to eat, and transportation. Tourism is a service activity that utilizes natural resources and a unique environment, such as cultural products, historical heritage, beautiful natural scenery, and a comfortable climate. A tourist trip is a round trip that takes more than three days, which is carried out alone or arranged by the General Travel Bureau by visiting several cities or places both at home and abroad. Thus, tourism can be said as a trip made for recreation or vacation, and also preparations made for this activity. A tourist or tourist is someone who travels at least eighty kilometers from his home for recreational purposes. In addition, in Islam tourism is always associated with worship, or traveling to remember Allah, such as pilgrimage, hajj, umroh, and so on.

Keywords: Tourism, Travel, Industry, Indonesia.

ABSTRACT

Historically, collecting, maintaining and studying the artefacts have been the primary functions of museums. However, in last decades more emphasis is being given to exhibitions and imparting knowledge among audience. Due to this, museums have started adopting technology in administration and knowledge sharing. This paper will examine that how Sikh museums are innovative in this regard with the help of following museums: Khalsa Heritage Centre - 'Virasat-e-Khalsa', with its 400-seater auditorium, permanent exhibition spaces, two-storey library, two clusters of slopping galleries along with their striking skyline, Central Sikh Museum, Amritsar displaying antique weapons, manuscripts and portraits to illustrate Sikh history and culture and Baba Baghel Singh Sikh heritage multimedia museum, New Delhi – emphasizing Sikhi principles through artwork, murals, digital screens, multilingual sound. These museums have expanded their horizon beyond the traditional bounds and are proving useful in imparting knowledge. These museums have connected people to people and people to information. As the economic Times have reported that Virasat-E-Khalsa has emerged with most foot traffic, over 5000 tourists visiting daily. Hence these are not merely developing as informational sources but as agents of social and economic transformation. This paper attempts to analyse that how Sikh museums are playing their crucial role in stabilising knowledge and transmitting it to the audience. Various forms of knowledge traditions will also be explored.

ABSTRACT

This project paper aims to systematise the existing criminal records of the Nigeria police. The essence was to produce robust criminal records and avoidable loss of criminal records. Structural database management system (DBMS) was used in its development in order to remove redundancy in the compilation, its friendliness in responding to the user exhibits and also its reliability and efficiency in tracking down criminals. Another important feature of this Crime Information Management System is that it provides user with the facilities for having the hard copies or print out of any relevant document as well as the facilities to communication with the system. Tracking is the observing of persons or objects on the move and supplying a timely ordered sequence of respective location data to a model e.g. capable to serve for depicting the motion on a display capability. The traditional and age-old system of criminal record and file processing has failed to live up to the requirements of the existing crime scenario. Manual processes neither provide accurate, reliable and comprehensive data round the clock nor does it help in trend prediction and decision support.

ABSTRACT

This research delves into the complex intersection of climate change, human trafficking, and prostitution, uncovering intricate connections between environmental disruptions and exploitative practices. Human trafficking for prostitution, often driven by poverty, takes on new dimensions when viewed through the lens of climate change. This study investigates how climate-induced vulnerabilities propel individuals, especially women, into prostitution as a dire means of survival. The study identifies multifaceted pathways through which climate change indirectly exacerbates human trafficking and prostitution. Climate-related displacement and migration render populations susceptible to trafficking and exploitation. Disrupted local economies, a consequence of climate impacts, force women and children into prostitution for basic sustenance. Depletion of resources due to climate adversity further drives individuals towards trafficking. Climate-related disasters amplify vulnerabilities by damaging infrastructure, making vulnerable communities more receptive to traffickers' influence. The influx of post-disaster temporary labour opportunities creates fertile ground for traffickers to exploit desperation. The research expands the narrative beyond the conventional focus on climate change's environmental consequences. It highlights a shift from legitimate income sources to forced prostitution, revealing that older women, traditionally less vulnerable, are now trafficked, demonstrating the interconnectedness of age, poverty, and exploitation. Climate impacts, coupled with pandemic-induced vulnerabilities, contribute to the exploitation of older women in climate-affected regions like South and North Parganas. The study underscores climate change's broader ramifications, including its impact on women, children, and minority groups vulnerable to trafficking due to climate-induced migration. Examples from Accra, Ghana, underscore the correlation between climate migration and exploitation, necessitating targeted interventions to mitigate vulnerability. Recognising the global nature of climate change's impact, this research advocates for international collaboration. Non-governmental organisations (NGOs) play a pivotal role by bridging the gap between communities and governments to prompt responsive actions, skill-based education, and economic stability in disaster-prone regions. In conclusion, the

research underscores the need for comprehensive approaches to tackle the interlinked challenges of climate change, trafficking, and prostitution. It emphasises the role of NGOs in advocating for vulnerable communities, promoting gender equality, and fostering sustainable livelihoods. By elevating these concerns to the international stage, governments can be spurred into action, proactively addressing vulnerabilities and safeguarding marginalised populations from exploitation amidst evolving climate dynamics.

ABSTRACT

With the growth in the number of web users and necessity for making information available on the web, the problem of web personalization has become very critical and popular, Ambiguity in getting information about hotel, rooms availability and lack comprehensive mechanism for saving guest information for future use are the major setbacks, hence, the need to develop an online reservation system that can offer the speed and convenience of one-stop availability check and confirmation in reservation process. The methodology applied in developing this system is Waterfall paradigm. Fact findings were conducted by visiting web sites of other hotels from internet as well as interview. In conclusion, this automated system is aimed to save time and money for users, thus resulting higher profit to the hotel and better service delivery to its customers.

ABSTRACT

This project paper aimed at developing a software platform that will help a Courier Service Tracking System to determine the current position of vehicles, freight or parcel with a navigation system installed, this facilitates, among other things, efficient allocation of pick-up and delivery of goods, increased equipment utilization, effective maintenance scheduling, improved parcel security, decreased asset losses, and rapid assistance for vehicle in need of help or repair.

ABSTRACT

News and event system is a platform developed in order to alleviate the problems faced by numerous organizations that use the notice boards method to pass information. The software tackle problems associated with the use of notice boards which include; information not reaching the target audience in real time, loss of important files, and news or information been tempered with during the process of transmission. The project was conduct so as to develop a software that will be able to take care of all the processes that are involved in automating the notice board method of conveying news and events, this includes; to effectively and efficiently disseminate information about real time news and upcoming events, to provide a reliable source of information, and to bridge the gap between heads of organizations and their staff. The software is designed to carter for the needs of activities document news and events system through the automation of the existing manual system. HTML and XPSS as used to design the GUI, PHP my admin was used to design the database and XAMP server was used to preview the work on browser.

ABSTRACT

This research will provide a more accurate picture of the Lumbardh River's water quality in the study region. Several physico-chemical parameters, such as; temperature, pH, EC, TDS, major ions (Ca^{2+} , Mg^{2+} , Na^+ , K^+ , NH_4^+ , NO_2^- , Cl^- , NO_3^-) were determined. Heavy metals have been analyzed using inductively coupled plasma optical emission spectroscopy (ICP-OES). In the water sampling sites, the concentration of Fe as the most abundant element was: 0.897 to 0.485 mg/L, Zn varies from 0.513 to 0.392 mg/L, Ni from 0.174 to the highest of 0.235 mg/L, Mn 0.141-0.194 mg/L, Pb 0.142-0.254 mg/L, whereas As, Cd, Co, Al and Co, were under limit detection in all of the water samples. Also, in the sediment ones the highest concentration element is Fe, followed by Zn, Mn, Ni and Pb. The highest concentration of Fe is in sample M3. The concentration varies from 0.985 mg/kg to the lowest of 0.698 mg/kg, Zn from 0.913 to 0.565 mg/kg, Mn from the highest of 0.413 to the lowest of 0.186 mg/kg, Ni 0.212 to 0.185 mg/kg, Pb 0.187 mg/kg to 0.143 mg/kg, followed by Cu, Co and Al. Even in the soil samples, iron varies from; 0.652 mg/kg to the highest of 0.989 mg/kg, Zn starts from 0.589 to 0.798 mg/kg, Mn from 0.119 to 0.189 mg/kg, Ni 0.139 to 0.178 mg/kg and Pb 0.163 to 0.189. The concentration of Co was observed in three soil samples from 0.033 to 0.064 mg/kg, whereas, Al is presented from 0.045 to 0.054 mg/kg followed by Cu from 0.049 to 0.098 mg/kg. The study shows that we are dealing with moderate pollution with these elements in the river, but to have a firm conclusion, it is advisable to examine more the zone of study.

ABSTRACT

This research work involves the construction of signal detector which is capable of detecting incoming and outgoing signals from mobile phones. The presence of an activated mobile phone can be detected by this portable size mobile signal detector from a distance of 1m to 1.5m which could be used to prevent the use of mobile phone in prohibited environments where they are not to be use such as examination halls, prisons, conference rooms, classrooms, hospital etc. it is also suitable for detecting the use of mobile phone for spying and unauthorized video transmission. The results obtained shown that the ranges detection between the detector and the active mobile phone are, incoming and outgoing calls is 1m, incoming and outgoing SMS is 1m and the GPRS network has the greater value which is 1.5m. All these tests were carried out when the mobile phones were on active or silent mode and not on flight or switch off mode. The moment the gadget detects radio frequency (RF) transmission signal from an activated mobile phones, the beep alarm will starts sounding and the LED blinks. The alarm and the LED will continue to show its indication until the transmission ceases.

ABSTRACT

The construction industry at large is beginning to take advantage of digital technologies through big data, data analytics, internet of things (IoT), artificial intelligence, machine learning and deep learning to enhance the effectiveness of project delivery. The construction industry in developing countries has been said to be under-digitized with organisations failing to realize the full potential and adoption of digitalisation as a driver for growth and efficiency in the industry. Also, the delay in project delivery, cost inefficiencies, uninformed decision making, poor quality and poor performance in terms of productivity have been characterised as a result of absence of adequate digital expertise and technological adoption within the construction industry. Thus, this study reviewed selected literature on influence of digitalisation on construction project delivery and challenges faced in the Nigeria construction industry, intending to establish the current adoption level, highlights some significant challenges and suggests ways to mitigate the challenges. The review revealed that use of digitalisation in construction project delivery in Nigeria is still very low. With sets of challenges such as legal issues and regulations, cultural issues, lack of awareness, security, higher initial costs, project uniqueness, resistance, robotics, institutional and informational sharing. Thus, the study suggests rigorous awareness, especially among the concerned professionals and stakeholders, establishing digital knowledge, basic skills and training from grassroots, usually from the tertiary institutions and related professional bodies, and enacting government policy that will encourage and enforced the adoption and implementation of digital technology in the Nigeria construction industry.

ABSTRACT

Many methods can be developed to preserve and conserve historic cities, which must be transferred into the future along with their tangible and intangible cultural heritage. One of the most important steps in preserving cities is to protect their users. Ways to protect users include preserving livelihoods, creating new livelihoods, and maintaining and increasing economic levels. In this context, tourism is one of the most widely used methods of preserving and maintaining historic cities, as outlined in various documents published by ICOMOS. Tourism can serve as a valuable tool for the preservation and continuity of historic districts. In addition, tourism paves the way for the design of new structures within historic towns. There is a need for new structures that can fulfill functions that the existing building stock cannot, and that are appropriate to those functions in their spatial context. Museum and art structures can be realized through the redesign of the existing building stock or through new architectural designs. Research conducted around the world and in Türkiye shows that museum buildings are often designed as symbolic, dominant, minimalist, or plain buildings. Both types of buildings contribute to the spread of tourism and historic urban environments.

CONTEMPORARY BUILDINGS IN RURAL SETTLEMENTS

Dr. Zahide Sena Güneş Kaya (ORCID: 0000-0002-1595-6991)
İstanbul University, Architecture Faculty, Department of Architecture,
İstanbul-Türkiye
Email: zsgunes@istanbul.edu.tr

ABSTRACT

Traditional houses in rural settlements deteriorate over time. The main reason of deterioration is disrepair. The maintenance of traditional houses that have been disrepaired for a long time becomes more difficult. In this case, constructing a new building appears as a faster and more economical solution than repairing the existing one. People living in rural settlements generally prefer to build new structures. Apartments, which are the components of the urban texture, are increasing in traditional environments, since the design process is not given attention in the new building. Compatible designs with the original texture can be produced by analyzing correctly the existing texture. Contemporary buildings in rural regions of Europe can be considered successful. The level of public awareness and economic income are effective in this situation. The availability of the design service is also an important factor. There are also qualified contemporary buildings in rural areas of Türkiye. For example, the buildings of Nevzat Sayın in Yahşibey are noteworthy. These buildings contain the comfort of urban life, the requirements of rural life and references to the original texture. Attention should be paid to the design process, in order to increase quality of new buildings in Türkiye. It is important to come up with solutions that will make the life of users economically and socially easy.

SEARCHING FOR NATURE IN ARCHITECTURE IN THE HISTORICAL PROCESS AND BIOPHILIC DESIGN

Research Assistant Mine Batal

İstanbul Yeni Yüzyıl University, Faculty of Architecture, Department of Architecture,
İstanbul-Türkiye

Email: mine.batal@yeniyuzuil.edu.tr

ABSTRACT

Humanity's ability to dominate nature started with agriculture 12,000 years ago and has continued to develop with the ongoing urbanization activities for 6,000 years. The relationship between the human and the nature, and the forms of interaction, which finds itself in the built environment by separating from nature, are also reflected in the practice of architecture. Although it does not cover a process that was consciously researched and produced in the early ages, every architectural product has been a direct historical indicator of the nature-human relationship. These indicators sometimes differentiate according to how nature is defined, with which philosophy it is handled or what it serves in design, and they become different representations of nature pursuits and form different design approaches based on nature. This scope of work; Art Nouveau, Organic Architecture, Green Architecture, Ecological Architecture, Sustainable Architecture, and Biomimetic architecture approaches have been discussed due to their theorizing on the foundations of the relationship between nature and architecture and taking their place in the history of architecture with this aspect, and similarity with the biophilic design approach, which stands out with the aim of providing nature experience especially in mega cities. and their differences are discussed. With this research, it was aimed to analyze the relationship of humanity with nature on a spatial scale, to discuss the role of nature in the discipline of architecture, and to make predictions about the future of nature in architectural design practice. As a result, it has been revealed that biophilic design has a more inclusive understanding as it mostly includes all the design inputs (form, function, economy and energy) and all of the design approaches led by nature. In this context, biophilic design; With its aspects such as improving human health and well-being, strengthening the sense of belonging to nature and environmental awareness, and helping to protect nature in the long term, it offers great potentials for today's people in search of nature.

ABSTRACT

Today, natural resources are being depleted rapidly due to developing technology and industrialization, environmental pollution and global warming are emerging as the current problems of the world. The fact that a significant proportion of existing structures are built without considering ecological approaches causes unconscious depletion of natural resources. For this reason, besides the construction of new buildings with a sustainable architectural approach, the potentials of existing buildings should be determined and steps towards ecological improvement should be taken. Among the steps taken, educational structures are important. It has been stated in many researches that taking part in an ecologically oriented education environment from an early age, sustainability and environmental awareness contribute significantly to learning by experience. In this context, two kindergartens, one of which is a state and the other is affiliated to a private institution, in Selçuklu district of Konya province were randomly selected. The buildings were examined within the scope of sustainable architecture, while their existing ecological features were evaluated positively, suggestions for ecological renewal were presented through world examples. In the study, a literature review focused on ecology, children and educational buildings was made, and then on-site observation, photographing and in-depth interview techniques were used to determine the appropriate and problematic aspects on the basis of ecological criteria of the sample buildings. In this study, which was prepared with the idea that raising the environmental awareness of the society can be realized with education and children; designing the buildings where preschool children receive education with a sustainable architectural approach; It has been concluded that it plays an important role in the formation of ecological awareness and in gaining livable environmental awareness. The ecological characteristics of both educational policies and physical spaces constitute the infrastructure of environmentally conscious societies.

ABSTRACT

Türkiye is located on active fault lines within the Alp-Himalaya Earthquake Belt. As a result of this situation, particularly in recent years, highly destructive earthquakes have occurred. The most recent examples of these devastating earthquakes are the February 2023 earthquakes with magnitudes of 7.8 (MW) and 7.5 (MW) that occurred on the 6th of February, 2023. Thousands of buildings were demolished in these earthquakes in Türkiye. In the buildings that didn't collapse, there are a significant number of heavily and moderately damaged structures. 10 provinces were affected by this earthquake and among the damaged buildings, there were also historical buildings that needed to be conserved. These historical buildings, most of which were built with masonry construction technique, lack "ductile" behaviour, which is important in earthquake behaviour. In the scope of this study, expert reports published after February 2023 and news articles in the media were examined to assess the conditions of historical bridges located in the earthquake zone. Among the historical masonry bridges with significant architectural value that need to be preserved, the following were investigated: Cendere Bridge, Kızılın Bridge, Şeytan/Mamluk Bridge, Vijne Bridge, Ceyhan Bridge, Batıyaz Bridge, Demir Bridge, and Danaahmetli Bridge. As a result of the examinations, it was determined that some of these bridges were completely destroyed, some suffered severe structural damages, some incurred non-structural damages, and some remained undamaged. The aim of this study is to identify what can be done to protect and strengthen these heritage areas located in earthquake-prone regions. The conclusions of the study identify important factors for the earthquake resistance of historical masonry bridges, as well as measures that can be taken before and after earthquakes to minimize damage. The aim is to ensure that these structures sustain minimal damage in the event of a new earthquake by implementing the determined measures.

ABSTRACT

Earthquakes in natural disasters; They are disasters that cause deep wounds economically, sociologically and psychologically. The big earthquakes in Kahramanmaraş on February 6, 2023 in our country caused many loss of life and property. Entrepreneurs from all professions play an important role in post-disaster recovery, with innovative solutions and efforts to improve. Among them, the professional discipline of architecture and interior architecture is at the forefront. In this context, it is aimed to raise the awareness of interior architecture students who receive design discipline education about natural disasters, to develop innovative and permanent solution proposals after disasters, and to reveal original designs that raise awareness. Within the scope of the project, it is aimed to develop solutions for the problem of meeting the unfinished education, play and spatial needs of the children most affected by the earthquake in order to overcome their traumatic situations. In this context, Selcuk University, Faculty of Architecture and Design, Department of Interior Architecture, 2022-2023 Spring Semester, Interior Architecture Project-IV course, together with the 3rd grade students, in the workshop on the subject of 'temporary foldable children's socialization spaces after the earthquake' online. has been carried out. Within the scope of the workshop, foldable tent design suggestions were developed, and as the limitations of the shell design; foldable, modular, light and portable, manufacturable, flexible and packable has been defined as a design problem. As the method used in the workshop; A 3-stage systematic method consisting of analytical understanding, creative decision making and application for design-oriented learning was applied. While the analytical phase includes the data collection process, the original form-form generation takes place in the creative phase in the shell and interior design process of the obtained data. At the end of the workshop, the boundaries of the interior architecture students in the search for solutions to the design problem were drawn and creative designs were created in the students' decision of function, form and structure. In addition, in the function solutions for the problem presented, foldability was associated as a keyword as a guide in form decisions, and they developed a working doctrine that could design at different scales from equipment to space design within the method.

ABSTRACT

Disasters, especially seismic disasters, play a critical role in shaping the earth. Landforms are also determinants in the formation of urban patterns. The pattern of a city is one of the essential parts of that city's daily life practices and identity. Seismic disasters, which form the landforms that make the urban pattern unique, can also devastate this pattern. Numerous major earthquake disasters have been documented since ancient times. As a result of these earthquakes, it is tough to carry many elements that make up the city's identity today. The lack of representation of identity elements in the city damages the collective memory of the city. This study aimed to examine the adverse effects of the destruction caused by earthquakes on the continuity of urban texture and identity. Bursa, the first capital of the Ottoman Empire, which is discussed within the scope of the study, is a leading city in terms of natural riches, history, and industrial identity. In this context, the earthquakes and the changes in the urban pattern and identity after these earthquakes were examined chronologically. The effect of the changing pattern in the city on the urban identity has been reconsidered through the current urban pattern, and suggestions have been developed for preserving the urban identity and texture in case of a possible earthquake in the future. The study outputs will likely be a guide in drawing attention to the destructive effects of disasters on the urban texture and identity and developing strategies in this direction.

Email: aysegul-adymn@hotmail.com

ABSTRACT

With the rapid development of technology in recent years, we see significant changes in many sectors such as architecture. Virtual reality is one of the most prominent of these changes and has now become a part of architectural design and applications. Virtual reality has become particularly important in recent years, both as a result of technological advances and because of its wide acceptance in popular culture. Virtual reality-themed films explore this concept from many different perspectives, often incorporating unique and innovative architectural elements in the process. These films can inspire the design and development of large, virtual reality-based universes called metaverses. Metaverse universes are virtual spaces that are often shared and interacted with by a wide range of users, and they often have a wide variety of aesthetic and design features. In this study, the interaction between prominent architectural elements in some popular movies with a virtual reality theme and the increasingly popular and expanding Metaverse universe will be examined. Also in this study; can make an important contribution to the science of architecture and design by examining in depth the impact of digital technology on the formation and evolution of architectural designs. Understanding how advancing technologies such as virtual reality and metaverse universes affect architectural design processes and outcomes can help architects and designers use technology more effectively and creatively.

ABSTRACT

The field of drug discovery has undergone significant advancement with the adoption of rational strategies that leverage the fundamental understanding of protein-ligand interactions. Two prominent approaches, namely, structure-based drug design (SBDD) and ligand-based drug design (LBDD), combine cutting-edge concepts from modern chemistry and biology, effectively merging medicinal chemistry with structural biology. This research presents a novel bioinformatics-guided technique for identifying promising breast cancer drugs. To evaluate the potential of quinoline derivatives as antitumor agents and their applicability in breast cancer treatment, we conducted a comprehensive analysis employing three-dimensional quantitative structure-activity relationships (3D-QSAR) and molecular docking studies with the aromatase enzyme (PDB: 3S7S). By employing Comparative Molecular Similarity Analysis (CoMSIA), we established a robust 3D-QSAR model that exhibited remarkable statistical significance for Q^2 , R^2 and R^2_{pred} , affirming its high reliability. To validate the predictive capability of the model, we conducted an external validation using an independent test set, further confirming its accuracy. The findings of this study highlight the significant impact of electrostatic, hydrophobic, hydrogen bond donor, and acceptor fields on breast cancer activity. Leveraging this knowledge, we designed a series of potent aromatase inhibitors and utilized our best model to predict their inhibitory effects. Finally, the newly proposed drug candidates underwent evaluation based on ADMET properties, ensuring a comprehensive assessment of their potential efficacy and safety profiles.

ABSTRACT

Background Nutrients are the substances found in food which drive biological activity, and are essential for the human body. Several studies have emphasized that some nutrients may increase an individual risk for cancer, while others may be protective. Dietary nutrients may be converted into metabolites by intestinal microbes that serve as biologically active molecules affecting regulatory functions in the host. *Objectives* To demonstrate role of nutrients as functional foods in the management of immunity. *Materials and methods* This includes the role of macronutrients, micronutrients, and the gut microbiome in mediating immunological effects. *Nutritional modulation of the immune system has applications within the clinical setting, but can also have a role in healthy populations, acting to reduce or delay the onset of immune-mediated chronic diseases. Ongoing research in this field will ultimately lead to a better understanding of the role of diet and nutrients in immune function. Results* Probiotics may restore the composition of the gut microbiome and introduce beneficial functions to gut microbial communities, resulting in amelioration or prevention of gut inflammation and other intestinal or systemic disease phenotypes. A well-functioning immune system is critical for survival. The immune system must be constantly alert, monitoring for signs of invasion or danger. Cells of the immune system must be able to distinguish self from non-self and furthermore discriminate between non-self molecules which are harmful (e.g., those from pathogens) and innocuous non-self molecules (e.g., from food). *Conclusion* This presentation describes how diet and intestinal luminal conversion by gut microbes play a role in immune-mediated chronic diseases.

THE USE OF FRACTALS IN CANCER RESEARCH

Ajsel Budlla

Turgut Ozal College Durres (Algeria)

ABSTRACT

Fractals, intricate geometric patterns characterized by self-similarity across scales, have found profound applications in the realm of cancer research. This abstract delves into the burgeoning synergy between fractal geometry and oncology, illuminating its potential to unravel complexities in tumor growth, angiogenesis, and disease progression. Fractals provide a novel lens through which to explore the intricate branching patterns of blood vessels within tumors, aiding in the understanding of angiogenesis – a hallmark of cancer development. By quantifying fractal dimensions and analyzing the self-replicating nature of vessels, researchers gain insights into the chaotic yet ordered nature of tumor vasculature, offering opportunities for targeted therapies. Moreover, fractal analysis offers a robust framework for comprehending the irregular morphology of tumors. By examining the self-similar patterns within tumor borders, researchers discern the degree of tumor invasiveness and heterogeneity, crucial factors influencing prognosis and treatment strategies. Fractal dimensions have been linked to prognostic indicators, assisting in risk assessment and personalized treatment plans. In the context of cancer imaging, fractals aid in early detection and diagnosis. The self-similar nature of tumor growth manifests in various medical imaging modalities, enabling the identification of subtle irregularities that might otherwise be overlooked. This contributes to enhanced diagnostic accuracy and improved patient outcomes. This abstract highlights the burgeoning role of fractals in cancer research, elucidating their capacity to decipher intricate tumor characteristics, vascular patterns, and growth dynamics. By leveraging fractal geometry, researchers forge a pathway toward deeper insights into cancer biology, diagnosis, and treatment, fostering a promising interdisciplinary frontier at the crossroads of mathematics and oncology.

**QUICKLIME PRODUCTION FROM EGGSHELL USING RESPONSE SURFACE
METHODOLOGY**

Salisu Nuhu

Department of Polymer Technology, College of Science And Technology
Hussaini Adamu Federal Polytechnic Kazaure, Jigawa State
Email: salis4real29@yahoo.com

ABSTRACT

This study developed empirical response surface models for optimizing the quicklime characteristics. The calcination process parameters evaluated were calcination temperature, calcination time, and eggshell particle size. Two process models were successfully developed and validated for RSM models. The modeling validation runs were within the 95% prediction interval of the developed models and their residual errors compared to the predicted values were less than 5%. Results from this study shows that the significant parameters that influenced the quicklime yield and reactivity are calcination temperature, calcination time and eggshell particle size. The RSM approach shows that a compromised setting of calcination temperature of 945.91°C and calcination time of 180.82 min will produce quicklime of optimal yield of 99.6608 % and optimum level of calcination time of 210 min and calcination temperature of 895.03°C produced optimum quicklime reactivity of 0.467835°C/s. The RSM models developed in this study can be used in the quicklime production industries to find the settings of the calcination process that will maximize quicklime quantity and quality. This will reduce the downtime encountered by industries having problems caused by variation in the quality of purchased quicklime.

ABSTRACT

Despite the research and designs carried out by various individual and institutions, poor and rural farmers in largely growing millet producing areas of Sub-Saharan Africa face challenges in accessing the dehuller because of prohibitive cost of the machine due to non availability of the machine locally. A dehuller was developed and evaluated for threshing, separating, and cleaning millet seeds. The major components of the machine include threshing, separation and cleaning units. The component parts were designed using standard equation and formulae. The threshing operation is achieved by rotational motion of a cylinder fitted with beater pegs above a stationary grid. The machine was powered by a 2 hp electric motor. It was tested to thresh, separate and clean the millet seeds. The results showed that the machine had the highest threshing and cleaning efficiencies of 63.2 and 62.7%, respectively, when pearl millet panicles were processed at 13% moisture content and at an 800 rpm threshing cylinder speed. The lowest threshing and cleaning efficiencies of 40.68 and 50%, respectively, were obtained when the pearl millet panicle was processed at 17% moisture content and a 600 rpm threshing cylinder speed, and at 17% moisture content and 700 rpm. Thus, the optimum operating parameters of the machine were 13% moisture content (wet basis) of pearl millet panicles and 800 rpm threshing drum speed. The cost of the machine is estimated as 200 USD. The successful development of this machine is expected to reduce drudgery associated with the traditional method of threshing millet and therefore increase productivity of farmers.

STRATEGIES FOR OVERCOMING DIFFICULT SITUATIONS AMONG THE ROMA POPULATION IN ROMANIA

PhD Sorina Corman (ORCID 0000-0002-7841-732X)

Lucian Blaga University of Sibiu, Romania

Email: sorina.corman@ulbsibiu.ro

ABSTRACT

The aim of this paper is to inventory coping strategies as presented by the Roma population in 4 communities in Romania (2 towns and 2 villages). We present in the paper the relevant results of the project "The role of religion and religious actors in Roma social inclusion: towards a participatory approach" PARI – RO-NO-2019-0586. The research carried out is based on a qualitative methodology comprising: (Walking) in-depth interviews with Roma people (heteroidentification and self-identification); Semi-structured interviews with key actors (representatives of the public authorities, social workers, religious leaders, teachers etc.); Observation in communities – fieldwork notes. The research question this paper answers is: what helps Roma in the community to overcome difficult times/situations. The answers to this question were grouped into three categories: support from family ("If I have a problem I turn to my husband" F28 B; "I consult my children" M76 F), support from friends or neighbours ("I'm still talking to my girlfriend" F67 R, : "Maybe I'll call some more friends who know you and chat. You talk to someone to calm down... Yes, but with someone who understands you, not someone who judges you or criticizes you, because you are already upset" F30 B) and faith in God (No one helps me but God ("No one helps me but God " F74 B).

ELECTROCATALYTIC SYNTHESIS OF HYDROGEN AND AMMONIA FUELS

Hanfeng Liang

State Key Laboratory of Physical Chemistry of Solid Surfaces, College of Chemistry and
Chemical Engineering, Xiamen University, Xiamen 361005, China

Email: hfliang@xmu.edu.cn

ABSTRACT

Catalytic electrosynthesis has emerged as a highly promising method to synthesize high value-added fuels and chemicals (e.g., ammonia, urea, H₂O₂, carbohydrate, organic molecules), which are commonly synthesized by conventional methods that often involve intensive energy consumption and greenhouse emission. Currently the electrosynthesis of chemical fuels still suffers from large overpotential and thus high energy input due to the sluggish reaction kinetics and poor selectivity. In this report, we will demonstrate how the efficiency of the electrosynthesis can be improved by catalyst and electrolyzer design. Specifically, we will give a few examples on acidic oxygen evolution reaction electrocatalyst design, bipolar hydrogen production by coupling hydrogen evolution reaction and small molecular oxidation reaction, as well as electrolytic systems for simultaneous ammonia and electricity generation.

ABSTRACT

Particle Induced X-ray Emission (PIXE) technique is a fast, powerful, multi-elemental and non-destructive analytical tool, dedicated for the analysis of materials especially geological samples. Sediment samples collected from the Lagos port area, southwest Nigeria were analyzed by PIXE technique for their elemental composition and concentrations. The PIXE analysis was carried out using a 1.7 MV Tandem accelerator with energy of 2.5 MeV protons located at the Centre for Energy Research and Training (CERT), ABU, Zaria. Data analysis was performed in an interactive mode with the aid of GUPIXWIN analytical software. Identified elements are present in the fingerprint X-ray spectrum in levels of ppm. In this study, introductory results concerning qualification and quantification of major, minor and trace elements embedded in sediments obtained from the Lagos port area, are presented. Also, insights into the environmental quality of the port area was revealed. Validity of the technique was assessed using standard reference material (SRM) NIST 1646a estuarine sediment, and result was consistent with the certified one. The study uncovered potential anthropogenic influences and the significance of employing PIXE in environmental monitoring and assessments.

ABSTRACT

One major contributing factor to greenhouse gas emissions in the environment is the generation of hazardous gases in municipal landfills. Due to the potential negative impacts of this, it is essential to estimate the quantity and type of landfill gases in order to design and establish a gas collection system. Landfill gas emissions are influenced by numerous factors such as the waste type, its biodegradability, its methane emission potential, the degree of separation, and various other miscellaneous factors. In our study, the LandGem model was utilized to predict the amount of gases produced in the landfills of Tizi Ouzou. According to the results, a significant amount of CH₄ was released from 2010 to 2022, contributing to global warming. This energy loss can be harnessed and converted into electricity, thus enabling the landfill to become energy self-sufficient.

ABSTRACT

Diabetes is defined as metabolic disease commonly observed in the clinics and is characterized by hyperglycemia due to impaired insulin secretion, insulin resistance, or both, resulting in impaired metabolism of sugars, lipids, and protein. Diabetes's large incidence, diverse pathophysiology, progressive process and consequences all underscore the critical need for improved therapies. To control diabetes, many treatments such as insulin therapy, medication, and food therapy are available. Herbal plants are now used to treat diabetes since they have fewer adverse effects. However, current study was designed to evaluate the effects of Cheiranthus cheiri seeds on glucose level, insulin level, body weight and the

regeneration of beta cells in alloxan induced diabetic rats. For this purpose, adult albino rats weighing about 180-200g were used and kept at experimental research station of Department of Physiology at Government College University Faisalabad. Following the adaptation period of 7 days, the rats were separated into four groups. The negative group (non-diabetic) rats got a single intraperitoneal injection of normal saline and were fed routine diet. Second group was positive control (untreated diabetic) and received alloxan (150 mg/kg body weight) and standard diet. Third group was standard and received glibenclamide (10 mg/kg body weight) along with alloxan (150 mg/kg body weight) and standard diet. Fourth group was treated diabetic and rats received alloxan (150 mg/kg body weight) as well as ethanolic extract of Cheiranthus cheiri seeds (10 mg/kg body weight). On the 21st day, the blood sample was collected for measuring blood glucose level. Parameters like serum CBC, serum glucose, serum insulin, Oxidative stress markers (TAC, TOS, MDA) were assessed. For histological analysis, samples of pancreatic tissue were collected. One-way ANOVA (Analysis of Variance) and DMR (Duncan's multiple range) were used to statistically analyze the data. Results of current study revealed that Cheiranthus cheiri had significant effects on body weight and normalized the levels of fasting blood glucose, serum glucose, serum insulin in treatment group as compared to positive control group. According to histopathological examination, results indicated that the pancreas of rats in negative control group had fully active islets of Langerhans with normal pancreatic cells. However, in positive control group, pancreas showed destruction of β -cells, small sized islets of Langerhans and loss of cellular contents. The normal histological structure was restored in the Cheiranthus cheiri seeds-treated group, demonstrating that normal pancreatic parenchyma and completely functional β -cells in islets of Langerhans were advantageous for pancreatic beta-cell regeneration. Gene expression levels for INS-1, INS-2, PDX-1, and IGF-1 were observed in the group treated with Cheiranthus cheiri seeds. Additionally, Cheiranthus cheiri seeds enhanced beta cell performance and returned INS-1, INS-2, PDX-1, and IGF-1 expression to normal levels. In conclusion, it was discovered that Cheiranthus cheiri seeds are advantageous for the normal functioning of the pancreas and the regeneration of beta cells.

ABSTRACT

In the vocabulary of scientists and ordinary citizens, the word tolerance is increasingly used as one of the necessary conditions for mutual understanding in social life. It is considered as a fundamental sign of culture, which is designed to free the human community from the spirit of hostility, intolerance, hatred and to contribute to the gradual rooting of empathy, benevolence, and respect for another person in society. Tolerance appears as a certain vector of social relations, as a strategy of new sociologization. It is called to solve acute problems of reality in a balanced and impartial manner; to take care of understanding and cooperation in order to preserve the world intact. It acquires a special socio-cultural sound as a factor capable of overcoming confrontation and enmity, contributing to the establishment of co-existence, co-activity of people with different worldviews, acting as an effective way of preserving social balance. Self-discovery through history opens up new horizons of human existence in the vicissitudes of one's own destiny and helps restore the lost system of moral and spiritual coordinates. In this context, the historical heritage acquires a slightly different aspect, devoid of the alienation and ABSTRACTness of historical knowledge, oriented towards the search, formation of worldview landmarks of modern man, his ability to constructively, balanced resolution of social contradictions, readiness to nurture the sprouts of tolerance and mutual understanding in society. A tolerant, balanced, understanding approach to the knowledge of historical phenomena and processes is aimed at the study of a person, his inner spiritual and psychological world, the diversity of social life practices, that is, focused on the growth of the individual and growth through the prism of human society, delineating new horizons of his progress. An essential component of society's development is culture, which is designed to liberate society from hostility, intolerance, and hatred, and to promote the rooting of empathy, benevolence, and respect for the Other; freed from the spirit of hostility, hatred, and intolerance, into the life practices of society.

**THERMODYNAMIC AND MAGNETOCALORIC PROPERTIES OF A
GRAPHULLERENE 2D NANOMATERIAL**

Sanae Zriouel

Faculty of Sciences and Technology, Cadi Ayyad University, Marrakech. Morocco

ABSTRACT

The synthesis of graphullerene 2D nanomaterial with unexpected properties represents a groundbreaking achievement in the realm of carbon-based materials, holding promising prospects for the development of a novel category of two-dimensional 2D materials. Herein, we investigated the thermodynamic features and magnetocaloric effect of graphullerene-like structure through Monte Carlo simulations based on standard Metropolis algorithm. In this paper, we detailed the impact of the Hamiltonian parameters on the thermodynamic properties and magnetocaloric quantities of the system. Distinct characteristic behaviors were observed, including first- and second-order phase transitions, Q-type behavior and square hysteresis loops. Furthermore, it has been found that altering the magnetic field not only enables critical temperature regulation, but also significantly affects the magnetocaloric characteristics, including the magnetic entropy change and the relative cooling capacity. Our findings strongly suggest that the graphullerene-like 2D nanomaterial is a promising candidate for magnetic refrigeration applications.

ABSTRACT

This article explores the intriguing realm of contemporary theories on waterfront architecture, adopting an accurate approach to analyze waterfronts that have been recognized with significant awards. The growing transformation of urban environments has led to heightened recognition of the importance of waterfronts as lively and dynamic public areas, attracting the interest of professionals in fields such as architecture, urban planning, and environmental studies. This study aims to analyze a curated collection of prestigious waterfront projects to clarify the innovative concepts and methodologies underpinning modern waterfront architecture. The study highlights the impact of these theories on urban waterfronts, illustrating their ability to enhance the appeal and engagement of residents and visitors through the effective incorporation of natural components, sustainable practices, and community involvement. Through an examination of these illustrative case examples, this research enhances our comprehension of urban planning and architecture. This study offers significant perspectives on the symbiotic relationship between human activities and the natural environment, promoting a sustainable and appealing future for coastal towns across the globe.

ABSTRACT

Sustainability includes environmental, economic, social and cultural dimensions. Knowing that these dimensions are inseparable, this study mainly focus on social sustainability considering socio-spatial equity in public interiors. Reducing inequalities, increasing inclusion in public interiors make use of these spaces equal for everyone. Wheelchair users, compared to others who do not have any physical restrictions, are blocked for many reasons in different areas. One of these areas is accessibility of public spaces. Wheelchair users cannot experience the city they live in equally. In an ideal city, every urbanite should be able to benefit equally from all public spaces and services. In this context, achieving equality in every place and in every condition is possible to a large extent with design. For all situations, the availability of design by all users, turns it into a design for everyone. Considering these, in this study a research has been carried out on the interiors of piers and ferries of İstanbul. The study was conducted on a physical activity scenario based on the ability of a wheelchair user to travel independently without the assistance of another person in the piers and on the ferries running between them. The importance of these piers is that they have been preserved with some transformations and used since 19th century and therefore be involved in cultural dimension of sustainability.

ABSTRACT

Industrial archeology is an interdisciplinary field involving the material or immaterial evidence of documents, artifacts, structures, human settlements, and urban or natural landscapes created for or by industrial processes. The interventions proposed for the restoration and improvement of the building involve the actions over both brick masonry as

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

well as masonry walls. The rehabilitation provides a valuable vantage point on the complex process of transforming an industrial space into a modern museum, while preserving the building's historic value. The transformation process will involve a thorough analysis of the historical and architectural value of the hall. A key critical point in this process is the assessment of the masonry structure and the identification of defects that must be addressed before transformation. Non-destructive testing (NDT) techniques are used for this, as they provide valuable information about the integrity of the structure without causing other damages. In this paper, we present the assessment of an industrial hall based on radar techniques in order to be transformed into an industrial heritage museum. The radar techniques are geophysical methods that uses electromagnetic pulses in the radar and microwave frequency spectrum to detect anomalies in underground utilities and concrete substructures and are well-defined NDT assessment methods which can be used to obtain a high-resolution image of the subsurface and accurately evaluate the condition of structures.

ABSTRACT

Europe's cultural heritage preservation benefits by cutting edge technologies. Architectural heritage, i.e., antique buildings and small architecture elements are affected by natural (floods, earthquakes, fires) and anthropic (pollution, intentional damaging action), degradation processes being dependent on characteristics of used materials as well as the object's age, working conditions and random events. It is essential to perform structural health monitoring analysis for further preservation and restoration. Usually, cultural heritages are evaluated for example, for art objects by Photographic Documentation and Digital Imaging using UV or infrared light, X ray Radiography, Infrared Reflectography, Infrared thermography, meanwhile, for structures, classical non-destructive testing procedures as ultrasound, eddy current, or even ground penetrating radar can be employed. Non-destructive testing methods of the cultural heritage items have evolved once with development of data acquisition and processing procedures leading to their complete and accurate assessment. The extension of the research towards the architectural conductive heritage monitoring with electromagnetic sensors led to development of adaptive sensors arrays customized to the specific application. The methods involve both numerical approach and experimental investigation. This paper proposes to present the results obtained at the

ABSTRACT

The realization of the procedure followed in interior design within a method increases the quality of the finished design. The creativity skills of those who receive design education are therefore developed using a variety of instructional design models. The most well-known illustration of instructional design models is the ADDIE model. This model is a five-step, systematic manual that outlines what should be done at each stage of the curriculum. In the teaching process of many disciplines, the ADDIE model is used as a method that aids in understanding, visualizing, and categorizing the problem. In this study, it was examined what effects using the ADDIE model in interior architecture education has on students' ability to generate original ideas. By enhancing the creative thinking development potential of students who receive design education in the design process, it is hoped that the study will reveal original and qualified designs. The waiting rooms of pediatric emergency services and polyclinics serve as the study's source of data. The ADDIE model's stages were followed as the designs for these sample spaces were put into action. With the help of two groups of five fourth-year interior architecture students, two different spaces were designed.

Email: sevinct@itu.edu.tr

ABSTRACT

Since the 16th century, the separation of time-space notions from each other has served to commodify both time and space. The tools of representation were also disciplined to serve this system. Organizing 'disciplines' and 'professions' was part of the same process. This disciplined look began to use the tools of representation not as a means of establishing an authentic experience with the world, but to serve the desire to appropriate a commodified and transcendent space imagination. A disciplined look describes an order, and any ambiguity is the enemy of this order. Bauman, in his books "Liquid Modernity" and "Modernity and Ambivalence", talked in detail about the drive for order and the war against ambivalence of modernity. The 'author architect', who is the actor of the disciplined profession, tends to represent the measurable features of the space. He/she assumes that he/she can appropriate the commodified space by transferring it to the representation plane, reorganizes it and reapplies the organized transcendent idea to the physical world. Thus, since he/she has created a transcendent image of space, spaces constant changes as space-time are ignored, and it is tried to be kept in a certain form like a permanent monument. The whole system here is based on the illusion that there can be a conjugation between the transcendent idea on the representation plane and the physical world. If we look at the architectural practices that develop based on the understanding of time-space against the disciplined architectural profession and their relationship with representations; Instead of commodified transcendental space, we need to talk about a time-space idea where we accept that every moment of space has different characteristics. We can see architecture not as a practice that appropriates space and transforms it into a monument by creating a transcendent image of it, but as a practice that intervenes in a constantly transforming being at certain moments and continuously. We can see representational practices as one of the ways of subjectively relating to this variable, mystical, atmospheric world of existence.

Keywords: Representation, Ambiguity, Ambivalence, Discipline, Space-Time.

ABSTRACT

University campuses are urban spaces that have the quality of public space. Universities, which are urban in many respects, need to provide suitable and comfortable spaces for users. In order for universities, which are the centers of education and research, to raise awareness about universal design among their users, it is extremely important to make the campus in accordance with universal design principles. Having the function of a research center and socio-cultural space in addition to its education and training function makes university campuses open to use by users from different regions depending on flexible usage periods. University campuses should comply with universal design principles that encompass all user typologies. This study aims to emphasize the importance of designing campuses in line with universal design principles. In this direction, the central campus of KTO Karatay University, which received the 2023 spatial accessibility award (orange flag), was determined as the sample area. There is no specific limit to the wide scope of universal design. Therefore, a set of criteria was created to evaluate the sample area in line with a certain scope. According to the criteria set, the building entrances providing access to the campus area of KTO Karatay University central campus, the transition area within the building providing access to the campus open area and the campus open area were examined. The identified areas were observed, experienced and photographed. It has been determined that the entrance areas, transition zones and open spaces of the campus are partially sufficient in line with universal design principles. As a result, there are barrier-free areas provided by the university. However, for a holistic, inclusive and universal design, the campus area should be fully accessible.

ABSTRACT

Surface water is the utmost vital natural resource obtainable in the form of river, ponds, lakes and reservoirs. Mapping of water bodies acting a chief protagonist in assessing its areal extent as well as its quantification. However, mapping is a stimulating chore the forward-thinking techniques of remote sensing and geographical information system are moderately convenient as they make available precise estimation and appropriate information. The major rivers of Beki River Basin are such as Beki, Palla, Bhelengi, Chaulkhowa, Nakhanda, Kaldiya, Pahumara etc. The Normalized Difference Water Index (NDWI) method used to identify the different categories of surface water of the study area and tested various water parameters in pre and post monsoon period using weighted arithmetic index method. Main linear water bodies initiate in this area are perennial rivers and non-perennial rivers as well as the main Beki River which drift over a length of 135.13 km. Likewise, the areal surface water bodies in this extent are ponds, tanks, lakes and reservoirs with wetlands and beel covering an area of about 11.9 km².

ABSTRACT

Modern architecture in Cyprus was linked with the colonial experience on the island, and the approaches specific to postwar modernism continued increasingly after the colonial period. Towards the end of the 1950s, Turkish Cypriot architects who grew up abroad started to open their offices in Nicosia and started to contribute to this process. Turkish Cypriot Architect Abdullah Onar was one of them, who was active in the practice until 1996. His office presents significant examples, the majority of which were housing projects whether single family houses or apartments blocks. In his archives, there are 640 projects including apartment, mixed-use building, garage, factory, hotel, cinema, mosque, bank, printing house, passage, club, dining hall and gas turbine, office block, restaurant, assembly and theatre buildings. This paper aims to give a brief overview about Onar's architectural approach throughout the housing projects he designed in the island. This kind of a general analysis is essential to read the architectural atmosphere and the traces of modern life during that period in Cyprus. Particularly the houses, designed between late 1950s and late 1970s, seem to have developed through a reconciliation between the local and the modern, which also coincides with the anxieties discussed in the international architectural circle of the period. The term "critical production" implies modern architecture practices that are re-evaluated in the context of local conditions in different geographies. In this study, Onar's housing projects are critically analyzed through this concept

ABSTRACT

Kevin Lynch describes five elements of the city image in his well-known book: The Image of the City. Landmarks, one of these five elements, are examined in this research. Studies on urban landmarks usually concentrate on single buildings or objects as landmarks and investigate them as external reference points in cognitive mapping. This study initially examines whether some open public spaces are perceived as landmarks and their attributes in perceiving them as a landmark. The study also investigates whether these open public spaces can be considered as one of other four elements of the city image and how it relates to perceiving an open public space as an urban landmark. College students were the participants of this study. After their eight-week training on the basic concepts and case study sites related to landmarks and open public spaces, students who agreed to participate this study (74 students) were asked to pick an urban landmark in their living environment and to visit the selected site with an observation checklist to fill out. Then, students were interviewed about the reasons for selecting their site. Initial results illustrate that most participants have chosen parks and squares as urban landmarks and considered these areas as nodes simultaneously. In addition to this, even though there are a wide range of answers related to the reasons for selecting an open space as a landmark, interview results revealed that 'ease of accessibility' and 'having memorable moments' were most repeated responds to perceive the open public space they chose as an urban landmark.

ABSTRACT

Cultural heritage consumption plays a pivotal role in senior tourism, offering unique experiences and fostering a sense of connection with the past. This study explores the concept of responsible cultural heritage consumption for senior tourists in the historic Walled City of Nicosia. The primary objective is to examine the preferences and challenges faced by senior travelers in accessing and engaging with cultural heritage sites. Employing a qualitative research approach through interviews, on-site observations, and document analysis, were performed to obtain necessary data about the experiences of senior tourists in the context of cultural heritage attractions. The research findings reveal that senior tourists highly value authentic cultural experiences and seek opportunities for meaningful interactions with local heritage. However, barriers such as limited accessibility and lack of age-friendly facilities hinder their full participation in cultural heritage facilities. The study highlights the need for tourism stakeholders to adopt responsible practices and create inclusive environments, ensuring that cultural heritage remains accessible and enjoyable for all age groups. This research contributes to developing targeted strategies for responsible tourism management in Nicosia's Walled City by addressing the unique needs and expectations of senior tourists in cultural heritage sites. This may help to foster a harmonious coexistence between cultural preservation and sustainable tourism development.

ABSTRACT

Istanbul is an important metropolis known worldwide for its historical and cultural richness. Istanbul's World Heritage sites are special regions recognized by UNESCO worldwide as having outstanding universal values. Among the most important criteria accepted for Istanbul's World Heritage sites are the necessity to represent historical, cultural or natural heritage, to offer unique and extraordinary values, to have a universal meaning for all humanity and to be under protection. Various approaches are being adopted for the protection of World Heritage sites in Istanbul. Conservation approaches in these areas include various purposes such as restoring the historical texture, reducing environmental impacts, promoting sustainable tourism practices, increasing the participation and awareness of local people. What are the criteria for the selection of the World Heritage Sites of Istanbul and the approaches and strategies applied for their protection? constitutes the research question of the study. In this study; The selection process of Istanbul's World Heritage Sites, compliance with UNESCO's World Heritage Criteria, conservation strategies for the preservation of Istanbul's historical texture, world heritage site management and urban planning, urban conservation, urban design, approaches within the scope of sustainable tourism. and to evaluate the applications reflected in the space. The method of the study is an original study on world heritage sites and Istanbul world heritage sites and conservation, based on observations and interviews in the field in Istanbul and the literature on the subject. As a result, in this article; We can say that conservation strategies, world heritage site management and urban planning, urban conservation, urban design and sustainable tourism strategies are needed to preserve the historical texture of Istanbul.

ABSTRACT

Historic cities formed over a long period, become unique blends of different cultures and are invaluable as open-air museums. They represent their societies and their urban/architectural spaces, which are indispensable areas of social memory, worth preserving. However, especially urban pressures cause irreversible destruction in historic cities ruining the unique cultural and historical identity. In this sense, urban and architectural conservation practices are critical for more effective conservation and sustainability of the historic city. Some steps in urban and architectural conservation surely have been taken in Türkiye so far, but the concept of an effective management plan as an outcome of the contemporary conservation approach, has not yet been introduced to overcome the implementation problems in the traditional residential areas sustainably. Consequently, it is observed that the original historic architectural and urban qualities are fading away every day, through the destruction of these areas. These problems are believed to be due to the lack of an integrated heritage management system parallel to a legal framework including planning, urban and architectural conservation, as well as all stakeholders of this issue. In this context, Taşbaşı Quarter of Ordu Historic City Center is chosen as the case, in search of a solution to this widespread problem in Türkiye, to propose a heritage management system and maintain a digital database that will provide an integrated heritage management model between urban planning, urban and architectural conservation. This model and the digital database are expected to set an adaptable framework and model for similar cases in Türkiye.

ABSTRACT

One of the most important problems brought about by globalization in recent years is the loss of importance of locality and cultural values and the destruction of cultural heritage data with the destructions caused by natural disasters. Realizing this, societies develop various solutions to protect their cultural data. With the development of technology and the spread of digitalization, tangible cultural heritage data has been digitized and transferred to a digital archive. Intangible cultural heritage data are also stored in digital media as literary. In order to ensure the sustainability of cultural heritage values in memory, tangible and intangible data should be presented as a whole. The transfer of cultural heritage to future generations should be done not as a pile of knowledge, but as a fun and exciting form of learning. This study includes a methodological approach to the design of digital games, which have become popular especially among young people in recent years, with cultural heritage data. With this methodological approach, it is aimed to provide informal learning by increasing the curiosity and awareness of young people playing games designed with different cultural heritage values and players from all age groups. With this methodological approach developed, exemplary studies were carried out on cultural heritage areas with the students of Eskişehir Osmangazi University Department of Architecture, Architectural Project Studio. In the project studio, the students first identified the tangible and intangible data of cultural heritage areas, and then created digital game setups with these data.

ABSTRACT

The phenomenon of identity based on belonging, created by societies within defined borders, derives its Dynamics from all kinds of heritage left by ancestral descendants. The elements of cultural heritage, the foundations of which were established centuries ago, live on with the ownership of these phenomena by societies. In order for heritage values to survive, it is necessary to recognise and identify the value of cultural heritage, irrespective of its origin. Societies, which must be the guardians of cultural heritage elements, have different attitudes towards the interaction with this heritage element and the heritage value. The understanding of protection shown by the societies that connect with the cultural heritage assets with a sense of belonging and the approaches to heritage of the societies that do not see the cultural heritage asset as more than a physical good are diametrically opposed. In some societies, administrative decisions taken about the cultural heritage value are met with the reaction of the public with the thought that they may harm the heritage, while in some societies, the heritage itself is ignored by the administrative units. In this context, the ancient city of Isauria, which is located in Central Anatolia and contains traces of the Roman period in Anatolia, and the archaeological heritage sites belonging to the same ancient culture have been examined in the recent historical period and their current status. In this respect, the destructive attitude of the local people towards cultural heritage and the dynamics of this attitude are questioned.

ABSTRACT

The characteristics of the natural environment wield substantial influence over urban development and the shaping of cities. A city's integration with its natural surroundings ensures the maintenance of an existence, where the interplay between urban dynamics and territorial features is mutually impactful. Changes occurring in time within the city's expanse can yield significant effects on urban life and the pattern of settlements. This research seeks to explore the interconnectedness of nature and the city, its transformations over time and their repercussions on urban planning and architectural structures. In this study, the ancient city of Cnidus (Knidos), which is an important culture, art and trade center of the Caria region, is examined. The information obtained from the literature on the urban settlement process and the natural environment of the city were analyzed in parallel. The relationship between the ports, which are formed as a natural result of the topography, and the architectural structures, has been evaluated together with the natural environment data. The arrangement and orientation of buildings within the city are examined through a comparison of topographical characteristics and temporal changes. As a result of the study, it has been revealed that the positioning of the buildings in the city of Cnidus is clearly dependent on environmental information.

ABSTRACT

Riparian vegetation is a significant component of river systems, and due to its transitional nature between aquatic and terrestrial ecosystems, it possesses versatile socio-ecological functions. These areas establish a crucial connection between humans and the natural environment by offering a wide range of ecosystem services in physical, chemical, biological, and social aspects. Riparian vegetation supports biodiversity and human well-being by providing a variety of ecosystem services, including erosion control, water quality improvement, habitat provision, flood control, nutrient cycling, recreation, and heatwaves. These functions are vital for the health and functionality of aquatic ecosystems. This study aims to present the current state and structure of scientific publications on river ecosystems and riparian vegetation by examining the overall status of research conducted between 2000 and 2023. A bibliometric analysis will be employed to review scientific literature and evaluate research methodologies concerning riparian vegetation. Furthermore, by embracing the ecosystem services approach, it provides a general overview of the ecosystem services provided by riparian vegetation. In this regard, the study is important in identifying the necessary information and gaps required to assist decision-making and planning processes involving riverbank areas. The ecosystem services provided by riparian areas are crucial for the sustainability of water resources, the preservation of biodiversity, and human well-being. Therefore, the conservation, management, and restoration of riparian habitats are critical steps in ensuring ecosystem health and sustainability.

ABSTRACT

Changes in land cover and land use (LC/LU) caused by human activities are one of the main causes of hydrological process changes in watersheds. Therefore, understanding the interaction between land use activities and hydrological processes is crucial for supporting sustainable water use planning. The aim of this study is to evaluate the impacts of LC/LU changes on hydrological processes within the boundaries of Gala Lake National Park. In this context, land cover maps will be generated using supervised classification method with Landsat images from 1983, 2003, and 2023 to assess LC/LU changes. The SWAT (Soil and Water Assessment Tool) model, which is one of the widely-used semi-distributed basin scale eco-hydrological models for evaluating hydrological processes, will be utilized. With the SWAT model, the potential effects of LC/LU changes on hydrological processes such as runoff, infiltration, evapotranspiration and erosion will be evaluated. The impact of land cover and land use changes on hydrology provides vital information for integrated land use and water resource management. Water resource development planning should consider the changes in LU/LC to ensure sustainable development in the watershed. This study aims to contribute to the sustainable management of water resources.

**URBAN ARCHITECTURE IN BALTIC COUNTRIES
BETWEEN CENTRAL EUROPEAN AND NORDIC (SCANDINAVIAN) TRENDS**

Dr. Sándor Földvári (ORCID: 0000-0002-7825-0531)

Debrecen University, Faculty of Humanities, All-Faculty Courses in Baltic Studies,
Debrecen - Hungary

Email: alexfoldvari@gmail.com

ABSTRACT

The investigated problem is, how the identification of the Baltic peoples is reflected in their urban culture, in recent and former capitals. Considered aspects: - impacts made by the Russian immigration on urbanization, - how and to what extent the local traditions and special heritage are preserved in the urban architecture. Latvia and Estonia belong to the "Baltic" region in a narrower sense: former Hansa towns with merchant architecture: stores under the roofs of old houses from the Middle Ages, especially in Riga, which is the largest capital city, and already postmodern, too. In Tallinn, the "globalized" shopping complex around the Soviet-style Hotel Viru in the downtown may symbolize the postmodern character of the Estonians, as well. Vilnius stands out with its baroque heritage (unlike medieval Tallinn and Riga), and its special couleur locale, too: the old and new quarters are built cyclically, as an onion, not combining with each other. Thus, modern architecture is built around the downtown, while in Tallinn it is almost imposed in the downtown. Kaunas, after being a former Tsarist military garrison city, became the capital of independent Lithuania in 1920-30-ies; then, in Soviet-occupied Lithuania, Kaunas played the role of the "very, real" Lithuanian city, in contrast to Vilnius; all this has been reflected also in its external appearance, too. Consequently, in all three Baltic countries, the trend towards Nordic cultures and globalized urban culture is unequivocal, also in Lithuania which was a rather a Central-European country albeit nowadays strives to be Nordic. At the same time, all three Baltic countries take special care of their national heritage in the urban culture, too.

ABSTRACT

The present work, is about the dosage of the phenolic compounds of two Saharan plants, Anvillea radiata and Astragalus armatus and their insecticidal (Aphis gossypii) and microbial (Staphylococcus aureus, Escherichia coli, Pseudomonas aeruginosa, Candida albicans) effectiveness. The dosage of the total polyphenols and flavonoids is carried out by the method

of Folin-Ciocalteu and $AlCl_3$ respectively, the phenol contents of *Anvillea radiata* ethanol = 91.06 ± 13.8 , *Astragalus armatus* ethanol = 82.17 ± 10.8 , *Anvillea radiata* chloroform = 24.17 ± 4.12 and *Astragalus armatus* chloroform = $35.28 \pm 13.3 \mu\text{g EGA} / \text{mg DM}$. While the flavonoid contents remain low for all extracts (*Anvillea radiata* ethanol = 5.40 ± 2.8 , *Astragalus armatus* ethanol = 0.3125 ± 0.2 , *Anvillea radiata* chloroform = 1.6 ± 0.6 and *Astragalus armatus* chloroform = $0.312 \pm 25.7 \mu\text{g EGA} / \text{mg DM}$). Both chloroform and ethanolic extracts from *A. radiata* revealed antibacterial activity against *staphylococcus aureus* bacilli, with zones of inhibition of $10 \pm 2.6 \text{ mm}$ and $16.5 \pm 2.1 \text{ mm}$ respectively, on the other hand the four extracts of the two plants showed an insecticidal effect for the three doses.

ABSTRACT

The ecological knowledge of the artificial wetlands in particular the lakes of dam, of the development of their biological richness and their potentialities and their bio-ecological and socio-economic potentialities. Due to their biological diversity and crucial ecological roles that they play, these natural regions are extremely significant. Due to their significant capacity to provide proteins, they are also regarded as among the most productive environments, making them of tremendous economic importance. There are various wetlands in Algeria, notably the Biskra region, which features a number of sites that are significant both locally and regionally.both national and global. These are either natural sites, which are typically represented by wadis, or artificial sites, such as dams like the one in the Foum El Kherza study area, which, despite the diversity and richness of its natural resources, has received very little attention in terms of their knowledge and development. The dam that is the focus of our study is situated in the Saharan bioclimatic stage, where ecological elements are

susceptible to significant daily and seasonal changes. Ecological elements are subject to significant daily and seasonal variations. Characterization of the site's biotic and abiotic components has been made possible by the bio-ecology study of the biological resources undertaken from October 2019 to Mai 2020 on the 29 ha Foum El Kherza Dam artificial wetland. By examining and keeping track of a number of physico-chemical factors related to the soil, water, and the diversity of flora and fauna, it also enabled us to gain a general understanding of its significance. As a result, we identified the type of substrate, the physicochemical, bacterial, and biological quality of the water, as well as the presence of 33 plant species, 42 phytoplankton species, and 155 animal species, including 103 invertebrate species, 03 fish species, 04 amphibian species, 07 reptile species, 34 bird species, and 7 mammal species. This method allowed us to value the site's biological resources, assess their significance, and formulate management and conservation recommendations related to its socioeconomic status from the standpoint of long-term development.

ABSTRACT

Protecting the environment, including surface waterways, is one of the pillars of sustainable development, which represents a major challenge for the future of mankind and our planet. It is important to point out that Algeria is making great efforts to protect the environment and reduce chemical and biological pollution, well aware of the environmental and economic stakes involved in the problem of liquid waste. In fact, chemical substances are constantly being released into the environment, and can threaten the balance of aquatic ecosystems and human health. Consequently, to limit pollution, laws must be respected by setting standards for harmful substances discharged into water. This study's goal was to synthesize and construct biomaterials of the cationic and anionic types. These substances were utilized as adsorbents in waters that had been contaminated by various adsorbates that were probably prevalent in the environment. In order to describe the various materials, various approaches

(IRTF, DRX, MEB, BET, and ATG/DTA) will be used. Studies on the adsorption by these substances will be conducted while changing a number of variables, including pH, mass, concentration, and temperature. Removal of effluents in aqueous media, particularly the adsorption technique, which appears to be well suited to remove pollutants due to its shown efficacy as well as for financial reasons, using inexpensive adsorbents such agricultural and industrial wastes.

ABSTRACT

An Institutional Advancement Master with regards to the Food and Horticulture Association alludes to an expert aiding nations and associations improve and reinforce their institutional systems connected with food security, farming, provincial turn of events, and related areas. Institutional advancement centers around improving the adequacy and effectiveness of foundations, like government offices, non-administrative associations, research organizations, and different substances engaged with food and horticulture. The job of an Institutional Advancement Master can incorporate different errands and obligations, including surveying existing arrangements and guidelines connected with food and horticulture, recognizing holes and regions for development, and assisting with growing new approaches that advance feasible turn of events and food security. Planning and carrying out limit building programs for government authorities, ranchers, and different partners to upgrade their abilities and information in regions like farming creation, promoting, and asset the executives. Working with associations to work on their inner designs, cycles, and frameworks. This could include enhancing work processes, dynamic cycles, and correspondence channels. Working with cooperation and associations among different partners, including government bodies, common society associations, confidential area elements, and neighborhood networks, to advance composed endeavors for food security and practical horticulture. Supporting the turn of events and execution of information assortment frameworks to accumulate data on agrarian practices, creation, market patterns, and other important variables. This information can illuminate proof-based direction. Aiding the plan, execution, and the board of ventures pointed toward further developing food security, rustic turn of events, and rural practices. This could include planning assets, observing advancement, and assessing project results. Bringing issues to light about the significance of manageable farming practices, food security, and provincial turn of events. This might include upholding for strategy changes, directing studios, and spreading data through different channels. Supporting examination drives that add to working on farming works on, expanding efficiency, and addressing difficulties connected with food security and country improvement. With regards to the FAO, an institutional advancement Master would work intimately with state run administrations, neighborhood associations, and different partners to recognize explicit requirements and difficulties inside the food and farming area. They would then create and execute procedures to improve institutional limits, cultivate joint effort, and advance maintainable improvement in accordance with FAO's objectives and rules. Generally speaking, the job of an institutional advancement master in the Food and Farming Association is crucial for guaranteeing that nations and districts have the essential institutional designs and abilities to successfully resolve issues connected with food security, agribusiness, and country improvement.

ZnBr₂-MEDIATED SYNTHESIS OF BLUE-LIGHT-EMITTING CSPBBR₃ PEROVSKITE QUANTUM DOTS VIA SUPERSATURATED RECRYSTALLIZATION

Dula Adugna Idosa

Faculty of Materials Science and Engineering, Jimma Institute of Technology, Jimma University, Jimma P.O. Box 378, Ethiopia

Email: duli.adugna@gmail.com

ABSTRACT

Recently, cesium lead halide CsPbX₃ (X = Cl, Br, and I) perovskite quantum dots (QDs) have attracted tremendous interest for their promising application in designing active layers of light-emitting diodes owing to their remarkable photophysical properties. However, the blue-light-emitting mixed halide (chloride and bromide) based CsPbX₃QDs lag behind their green and red counterparts due to chloride low defect tolerance nature. Therefore, tuning the green emission of CsPbBr₃ quantum dots (QDs) to blue through quantum confinement effects has received considerable attention due to its defect-tolerant properties. However, the synthesis of such a blue-emitting QD has been challenging. Herein, supersaturated recrystallization was successfully implemented in an ambient atmosphere to synthesize strongly quantum-confined blue-emitting CsPbBr₃ QD with ZnBr₂ covering the blue spectrum. The structural and optical characterization of as-synthesized QDs reveals that the particle size of the QDs decreased by incorporating an appropriate amount of ZnBr₂ solution into the perovskite precursor solution. As a result, a significant blue shift of the optical band gap from 2.30eV to 3.02eV is observed. The electronic band structure investigation of pure and Zn-doped CsPbBr₃ have been done for experimental verification using the first principle density functional theory (DFT) calculation. The present work provides an alternative strategy for synthesizing strongly quantum-confined QD materials for photonic devices such as light-emitting diodes and lighting.

ROOM TEMPERATURE SYNTHESIS OF CSPBBR₃ PEROVSKITE NANOCRYSTALS WITH OLIVE OIL AND OLEYLAMINE

Getachew Welyab Tsoni

Faculty of Materials Science and Engineering, Jimma Institute of Technology, Jimma
University, P.O. Box 378, Jimma, Ethiopia

Email: gwelyabt@gmail.com

ABSTRACT

All-inorganic halide perovskites have gained tremendous interest in developing optoelectronic devices including solar cells and light-emitting diodes due to their extraordinary properties such as simple solution preparation, high photoluminescence quantum yield (PLQY), narrow full width at half maxima (FWHM), and tunable emission over visible region. Despite such advantages, their properties still require improvement for commercial applications. This paper focused on the structural and optical properties of cesium lead-bromide (CsPbBr₃) perovskite nanocrystals (NCs). Here to address the objective, we applied a room temperature approach under ambient conditions for the synthesis of CsPbBr₃ NCs using capping ligands such as oleic acid/oleylamine (OA/OAm), and olive oil/oleylamine (OO/OAm) separately. The result reveals that high crystallite size was achieved during olive oil was used instead of carboxylic acid (oleic acid). Similarly, larger size distribution and shape of CsPbBr₃ NCs was obtained when olive oil replaced with oleic acid. On the other side, the optical property indicates that high photoluminescence (PL) as well as lower absorption was achieved in OA/OAm. Moreover, the size-dependent PL decay time of CsPbBr₃ NCs shows that perovskite NCs prepared with OO/OAm indicate longer decay time. Thus, the proposed capping ligand reveal improvements in the structural and optical properties. Finally, this work gives good insight for further study and replacement of expensive and acidic ligands by cost-effective and eco-friendly ligands for commercial optoelectronic device applications.

ABSTRACT

Background: Water stress is a phenomenon that describes when water demand is greater than the amount of water available at a particular period and also when water is of poor quality and restricts its usage. Nowadays, droughts and water scarcity are no longer rare or extreme events in Europe, and about 20% of the European territory and 30% of Europeans are affected by water stress during an average year. The growth in industrialization and economic development, which increases water usage, water ecosystem transformation, and a massive loss of biodiversity, etc., are causing water scarcity. *Purpose:* This study analyzes the main factors for water stress and lack of water in Balkan countries. *Design/Methodology:* Data proceedings are time series indicators for Balkan countries, with an annual frequency of 2002 – 2021. The statistical approach in panel data model is used to find statistical significance, direct on-driven fixed factors, etc. *Findings:* Fixed effects panel regressions demonstrate that water stress in this region is statistically significantly affected by climate change indicators (temperature and precipitation), economic indicators (water productivity, agricultural land, and growth of the gross domestic product), population growth, political stability, etc. *Practical Implications:* The government's role in supplying water and lowering water stress must build an efficient management mechanism and policies for water reserves such as groundwater, surface water, or rainwater. Dictated by the global and regional circumstances of climate change, governments should initiate strategic efficient plans for the good-using and sustainability of water.

A STUDY OF THE EFFECT OF MULTI-WALLED CARBON NANOTUBES ON POLYBUTYLENE TEREPHTHALATE

Zoubeida Taha Taha

Department of Materials Science and Technology at Óbuda University

Dr. Andrea Ádámné Major

Department of Innovative Vehicles and Materials, GAMF Faculty of Engineering and
Computer Science at John von Neumann University

ABSTRACT

After preparing test samples by adding the following ratios of multi-walled carbon nanotubes (MWCNTs) (0.2, 0.4, 0.6, 0.8, 1, 1.2 % wt) to polybutylene terephthalate (PBT) using extrusion connected to the mixer, the effect of adding MWCNTs on the crystallization behavior at isothermal and non-isothermal conditions of PBT has been studied using differential scanning calorimetry at the following cooling rates (2, 5, 10, 20) °C/ min. In general, the results showed that the addition of carbon nanotubes led to change in both the crystallization temperature and the melting range. This change depended on each of the different ratios of adding MWCNTs to PBT and the cooling rates, where the structure of the carbon nanotubes contributed to the improvement of both the crystallization rate and its behavior. This addition led to an increase in the initial temperature of crystallization and the peak temperature of crystallization with an increase in the loading of MWCNTs at the different cooling rates. As well, it was observed from the results that the presence of MWCNTs made crystallization start at an early stage because these CNTs acted as a strong nucleating agent that enhanced the nucleation of PBT when compared to neat PBT. It also caused a change in the melting behavior of the nanocomposite (PBT/MWCNTs) by moving the PBT chains, thus achieving a higher order for these chains. With the increase in the ratios of MWCNTs, the amount of crystallization increased, thus there was a change in the physical and chemical properties, which in turn affects the final properties of the composite material.

Keywords: Multi-Walled Carbon Nanotubes, MWCNT.

ABSTRACT

In this scientific study, the authors have dealt with slot milling of nickel-based superalloy. Nickel-based superalloys are among the most difficult materials to machine because it has high thermal strength, it is prone to hardening, carbides cause severe abrasion to the tool, and it has very poor thermal conductivity. Slot milling is a specific issue as it is characterized by rapid tool wear and frequent tool breakages. This is why reconditioned tools are often used in an industrial setting, which can significantly reduce tool-related costs. The machining parameters, such as cutting speed and feed employed also has a major impact on the lifecycle of the tool and the quality of the machined surface, so choosing the right cutting parameter is an important factor. Therefore, the authors have chosen three cutting speed values and three feed values. The effects of the tool geometry of the new and the renovated tools and the cutting parameters were tested focusing on the cutting forces and the average surface roughness on the bottom of the milled slots. The aim was to determine the best cutting parameters combination and investigate the effects of the new and the restored tool geometry. In all cases, the results show that the new tools were superior to their reconditioned counterparts. When choosing the technological parameters, it is advisable to use lower cutting speeds and higher feed rates.

ABSTRACT

The essential enhancement of diverse heat transfer applications hinges upon the synthesis and thorough exploration of thermophysical attributes inherent to novel nanofluids. A paramount investigation pertains to the heat transfer coefficient of MWCNT-TiO₂/DW, operating as the operational fluid within a segregating flow conduit subjected to a heating flux of about 10000W/m². The nanofluid was rendered stable through the inclusion of surfactants, facilitating an assessment and comparative analysis of heat transfer efficacy across a backward-facing step, alongside an evaluation of fluid thermophysical attributes. Notably, a remarkable augmentation was observed, approaching a doubling of the heat transfer coefficient, akin to the impact achieved by the incorporation of 100% MWCNT additive to the foundational water substrate, within the Reynolds range spanning from 2000 to 10,000. This augmentation holds significant import, presenting the potential for cost reduction in nanofluid production, while concurrently upholding heightened performance levels. This behaviour is expected to be due to the various methods of heat transfer through fluid and the combination of these methods presented by MWCNT and TiO.

TRUST BASED SECURITY SCHEME FOR WIRELESS SENSOR NETWORKS

Associate Professor S. A. Arunmozhi

Department of Electronics and Communication Engineering Saranathan College of
Engineering, Trichy

ABSTRACT

Resource limitation feature of wireless sensor networks brings the network performance very poor under various security attacks. Flooding attack is the one type that affects the sensor networks with lot of fake packets to consume more network resources. This doesn't allow the legitimate users to communicate effectively. It is also required to save the energy of sensor nodes under flooding attack. In this work, we proposed energy efficient trust value based defense method against flooding attack in sensor networks. The proposed scheme uses trust metrics based routing and SMAC protocol for energy efficiency. Trust values are computed based on the channel information and a priori information. The most trusted node is being used as the cluster head which plays a key role in data forwarding. This assures the trustworthy communication among the nodes in the network. Energy is a valuable resource in wireless sensor networks. The nodes in WSN will communicate with other nodes with limited energy in many applications. Changing energy sources is not feasible in most of the networking scenarios. This makes the network lifetime as a critical factor in the design of WSN. Hence energy efficient method of communication in WSN is essential. The energy consumption issue in the network becomes crucial when sensor nodes are engaged in malicious activities. Hence, it is considered that energy in the sensor nodes can be preserved by avoiding the attackers. In this proposed method, a Trust based Energy Efficient Security Scheme is proposed in which SMAC protocol is used for energy conservation and the trust metrics are employed to deal with security problems. For improving security in WSN, assessing trust among neighbor nodes is very much essential. Generally, the schemes developed for efficient communication may only concentrate on routing based on energy or trust values. To provide both energy efficiency and secured routing, a new Trust based Energy Efficient Security Scheme (TEESS) with clustering approach has been proposed in this work. The proposed scheme is validated by simulation. The experimental result shows that the proposed method improves the performance of wireless sensor networks effectively.

Key words: Denial of Service Attack, Energy Conservation, Security, Trust Value, WSN.

ISTANBUL'S HOUSING CRISIS IN THE POST-COVID ERA: CONSIDERING ALTERNATIVE SOLUTIONS

Dr. Özge Erbaş Melis (ORCID: 0000-0003-3338-658X)

İzmir Kâtip Çelebi University, Faculty of Engineering and Architecture, Department of City and Regional Planning Department İzmir-Türkiye

Email: ozge.eras@ikcu.edu.tr

ABSTRACT

Istanbul has been accommodating the largest amount of population as a metropolitan city in Türkiye. The city has struggled with the housing crisis in various time periods since 1950s. Through these times, Istanbul had squatter settlements, new regulations to legalise them and increase the housing supply with the Mass Housing Development Administration. However, there is another housing crisis post-COVID-19 era. Average rental house prices in Istanbul rose by over 600% between 2020 and 2023. This research focuses on the current demand and supply of housing with vacant housing, affordable housing projects and insecurity of private rented sector in the metropolitan city. Therefore; the data regarding housing and related issues are obtained from the official government agencies; General Directorate of Land Registry and Cadastre, Turkish Statistical Institute and Istanbul Statistic Office of Istanbul Metropolitan Municipality. The data is analysed with descriptive and inferential statistics. In addition to unearthing the existing struggles in the Istanbul case, the research investigates the effective policies in the various countries regarding affordable and inclusive housing. Afterwards, potential solutions are studied to overcome the current struggle of citizens which include national and local policy suggestions.

ABSTRACT

The aim of Landscape planning increases, improves or creates the natural, social/cultural and economic landscape resources with their visual/aesthetic values. Because of the biodiversity, ecological life functions and protection status potentials such as Ramsar Wetland, and also management threats, Ulubat lake was chosen as a study area. The ecological balance of the lake has been damaged by human activities and thus its carrying capacity is being challenged. The purpose of this research is to create a landscape protection plan and develop strategies with conservation priority for Uluabat Lake. To reach this aim, Geodesign, being an ecologically based approach that systematically examines the landscape, was chosen as the main method. Geodesign, systematically studies the landscape by creating models of representation, process, evaluation, change and impact, and relates each step to each other. The Habitat, Water, Soil functions were analyzed and revealed spatially. Plan principles and provisions have been determined within the scope of the protection plan that ensures healthy ecosystem functions and habitat sustainability. As a consequence, it is determined, the cultural activities affected the ecological systems of the lake negatively. Therefore Uluabat Lake, first 200 meters from the shore and its reeds were chosen as the core area. For this reason, it should be implemented the spatially specified strategies and restored the protection-use balance for the sustainability of the lake ecosystem. The method and findings of this research can set an ecologically protection model for the supporting system of relations and functions of protected wetland areas like Uluabat Lake.

HOUSING COOPERATIVES IN EUROPE AS A FORM OF SOCIAL ENTERPRISE

Ruslan Martinov

Trakia University, Stara Zagora, Bulgaria

Email: rmartinov@yahoo.com

ABSTRACT

In Bulgaria some Social enterprises are focused on providing housing and shelter for peoples with disabilities or risk of exclusion. The activities of these organizations are sponsored predominantly by local, state or EU projects. Thus, the House of Opportunity Programme creates family-type houses and offers 2 years of residential care and support to young people, leaving specialised institutions for children deprived of parental care. The Bulgarian "Chitalishta" traditionally created boarding houses for students from rural villages, supported schools and created public libraries. In other European countries (Austria, Germany, Switzerland, Spain, etc.), the Social enterprises, working as housing cooperatives, have important role in housing policies of their main cities ("Red Vienna" public housing model during the 1920s; now BWS administrates 22 000 apartments throughout Austria). According to the Austrian Statistical Office, 102 cooperatives were active in the housing sector. Limited-profit housing organizations are engaged in the construction and management of housing, construction of housing for third parties or car parks, where 84 organisations are engaged in the Household-related services. In Germany, the Housing cooperatives are active in both urban and rural contexts, and align under a sector federation with non-cooperative type social housing companies. In Zurich, about 25% of the city's entire housing stock is occupied by the not-for-profit accommodation. Thus, the cooperative housing becomes a negotiated process with policies and decision makers, together with the social housing providers.

Nigeria, Nsukka

ABSTRACT

Although progress has been made in examining different aspects of the environmental crisis in Nigeria, literature is yet to focus on the impact of site selection and the activities of Pentecostal churches in Delta State. In this study, we extended the literature on environmental realities by examining how Pentecostal churches have contributed to the environmental crisis in Delta State. The aim of this study was to explore: 1) how the site selection methods of Pentecostal churches affect the environment in Delta State; and 2) how neighbours perceive their experience of noise pollution in Delta communities. There is a dearth of literature on such associations, which makes this article timely, especially among the inhabitants of Delta State. A purposive sampling method was used to recruit participants. Twenty participants living in different areas close to selected Pentecostal churches were involved in the study. Semi-structured interviews were used to collect data. The face-to-face interview data were recorded and analysed using the method of qualitative inductive content analysis. Five themes were identified from the data of the transcribed interviews: illegal location of Pentecostal churches; site selection in areas within much human residence; regular daytime church services; frequent nighttime church services; and frequent quarrels with neighbours. Pentecostal churches are continually being located in residential areas, and noise pollution emanates from their day and night services.

ABSTRACT

As a result of the progress achieved by the disability rights movement in the last 50 years, barrier-free landscape design has become a prominent necessity for modern cities. Barrier-free landscape design, which holds great importance in urban planning and design processes, aims to improve the quality of life for disabled individuals and eliminate social, physical, and environmental barriers to their full participation in society. Public open spaces and urban green areas, such as squares, parks, and roads, are vital urban areas for both disabled and non-disabled individuals to socialize, and these areas should be designed to provide equal opportunities for all users. In this study, the barrier-free landscape design was addressed for Kayseri Avenue and Atatürk Boulevard, which have the most human mobility in the city center of Nevşehir. The study examined these routes within the framework of national standards and universal design principles. As part of the study, landscape applications such paths, sidewalks, ramps, urban equipment elements, and plant elements made along the designated route were examined in terms of accessibility, usability, comfort, and sensory aspects. Issues were identified, and design recommendations were proposed to facilitate the daily lives of disabled individuals through disabled-friendly design.

ABSTRACT

To evaluate the genetic diversity of Euphorbia resinifera O. Berg using ISSR markers. 12 natural populations were chosen from its geographical area of and analysed. Using 14 ISSRs primers generated 101 polymorphic bands corresponding to a percentage of polymorphism nearly 80%. This high percentage of polymorphism suggests that there is an important genetic diversity in this melliferous and medicinal species in Morocco. While the mean of I and Ht indicates that there is a high genetic diversity in this species. Thus, the high values of PIC and Rp parameters show that the ISSR primers are very informative and effective to analyse the genetic diversity of E. resinifera. The results of the AMOVA showed that the high degree of variability is present within population. The high value of FST suggest that the studied populations are highly differentiated in agreement with very limited gene flow between each population. Additionally, the genetic structuring of populations into two groups obtained from UPGMA and Structure analysis revealed a dependence on the geographical origin of the populations. the results of antimicrobial activity of the aqueous extract showed a pronounced antifungal activity against the tested strains. The data obtained will be useful to define conservation strategies and improvement programs of this melliferous and medicinal species.

ABSTRACT

Urban agriculture refers to producing, processing, and distribution of agricultural goods in urban areas for the community. Local, regional, and national governments play an important role in identifying the suitability of vacant lands for urban agriculture. It's known that urban agriculture has a high potential for the urban population, the economy, and the environment, all together for making a healthier city as well as a healthier community. However, urban agriculture is also subject to risks (e.g., air, water, soil quality) due to environmental conditions in cities. Today in the cities numerous and continuous anthropogenic activities going on that cause a high pressure on the quality of the urban environment. Determining suitable areas for urban agriculture is crucial for the sustainable development of urban areas. Considering the benefits of urban agriculture for sustainable development, city managers must identify the areas in the cities where sustainable urban agricultural development is safe for the community. There are some criteria studied in the literature used to evaluate this suitability such as climatic factors, soil quality, water availability, accessibility, market, etc. To better planning of land use in urban agriculture while considering environmental issues, should be given priority for the selection of land suitability assessment parameters. In this study, therefore, these parameters are discussed, and drawn a suitability assessment framework to enhance urban agricultural practices in the cities.

ABSTRACT

Criticism is a tool to understand how architecture interacts with power, with the world, and with each other today. Today algorithms are identifying what is visible by analyzing what we like to see the most. This state of looking takes place in the area that we begin to ignore and become numb, in other words immobile. This paper takes the well-known term 'mobility' in a different context, where 'immobility' implies an order established by dominant and hegemonic forms. I consider the term mobility as a breakdown and re-establishment of the dominant perspective with inspiration from the philosopher Jacques Ranciere. One of the conditions of mobility that bring about another kind of interaction is 'imperfection'. The purpose of this research is to use the notion of 'imperfection' in a critical context to reflect on the creative perspective. The physical incompleteness of the space creates a situation where it can re-establish its context, materiality, and relations. Imperfection or incompleteness is the possibility of differentiation as a design approach. So how can architecture become imperfect? Or, as Ranciere brought up the question; how can it undo its own mastery to create a new sensible world? The research draws on approaches and discussions on the concept of 'Distribution of The Sensible' by Jacques Ranciere, as well as imperfect and incompleted cases as an activator of "re-distribution".

ABSTRACT

The house, as one of the basic needs of all living things, has affected people's intellectual and life concerns throughout history by drawing contradictions. Turkish houses emerged typologically with the settlement of Turks in Anatolia as a result of several factors. The concept of culture emerges as a result of the plan typology of the houses and the establishment and shaping of their connection with the external environment. Protecting the privacy of family members stands out as one of the most important factors in the traditional houses of Islamic countries. The importance of the privacy issue affects the layout of the interior spaces, their size and their connections with other spaces. The importance of privacy affects the layout, size and connections of interior spaces with other spaces. This subject alone can differ in different geographies and families, inspired by economic conditions, culture, customs and also the climate. Traditional Turkish houses are designed with a keen understanding of the need for seclusion and personal space, reflecting the common cultural values and social norms in Turkish society. In traditional Turkish houses, privacy is related to the arrangement of living spaces and the planning of inner courtyards. In this study, providing the subject of privacy in the traditional Turkish house of the Islamic period is based on the view of creating a direct effect on the plan typology of the houses. Within the scope of the research, in addition to ABSTRACT studies, four different case studies were handled to embody the subject and the connection of the concept of privacy with culture and the effect they had on the plan typology were investigated concretely.

ABSTRACT

Architectural spaces are environments that are established and developed on the basis of providing the physical and psychological comfort of people. Architectural environments are the environments where people spend the most time with all their functions. According to research, people spend 87% of their daily lives in architectural spaces without distinction of function. The colors used in the spaces are one of the factors that directly affect the mental and physical health of people, just like light and temperature. Colors are responsible for the perceptions they create on people and for a series of conscious and subconscious stimuli in our psycho-spatial relationship. The effect of color in architectural spaces, when used effectively as an interesting phenomenon that greatly affects visual perception, has the potential to evoke certain emotional responses and shape the overall experience of building users. The effects that colors create on the perception of space should be changed depending on the function. It is possible to encounter this feature frequently in traditional architectures. In many existing examples such as mosques, churches, bazaars, houses and palaces, it is possible to see how colors are used to convey the perception of space suitable for functions. In addition to all the concrete examples that exist, extensive research has been carried out over the years to unravel the complex relationship between color and its psychological effects, enlightening architects and designers on the optimum selection and application of color elements. However, despite all this, in many modern buildings constructed today, functions and services are ignored without paying attention, while it is sufficient for people's perception of space, but also causes the disappearance of spatial identities. In this study, the effect of the colors used in traditional historical buildings on the perception of space has been examined and the results have been compared with modern buildings that have similar functions.

Keywords: Color in space, Perception of Space, Space Function, Psycho-Space Relationship.

ABSTRACT

In historical cities, urban public open space's identity is a fundamental aspect that contributes to shaping the identity of communities. Urban identity is the foundation to place attachment and a sense of belonging to the place. The urban identity reflects people's traditions, culture, aspirations, needs, and future. The architectural elements in urban areas succeeded in expressing the identity of the community and maintaining the continuity of identity. The city's identity determines by the city's geographical context, cultural level, architectural elements, local traditions, lifestyle, and quality of public open spaces. In recent years the multi dimensional place-making concept with a dynamic social context become an interested studying area in increasing urban identity. The concept of place-making coines to describe a multi-disciplinary approach in planning, designing, and urban public open spaces management to improve the urban environment and the quality of life. In this study, the conceptual framework of the topic drew by putting forth the concept of place and place-making to improve the quality of places in historical public open spaces. The studying area is Cumhuriyet Street in the historical center of Bursa City. The street is located in the traditional trade center as a pedestrian way. Due to Bursa's strategic position as the first capital of the Ottoman Empire, at the confluence of main trade roads, the historical background examine to demonstrate its potential in creating a place-making concept in the city's historic core.

RISING BEYOND CHALLENGES: EMPOWERING THE URBAN POOR WITH AFFORDABLE AND ECOLOGICAL HILLSIDE HOUSING SOLUTIONS AMIDST SLOPES AND RISKS IN PAHARTALI, CHATTOGRAM

Faria Binte Hafiz (ORCID: 0009-0003-5190-6929)

B. Arch., Department of Architecture, Shahjalal University of Science and Technology,
Sylhet, Bangladesh

Email: fariahafiz53@gmail.com

ABSTRACT

Bangladesh's main issue, the creation of an affordable housing project for the poor in Pahartali, Chattagram. The property, located on a modest slope beside Fay's Lake, offers a promising working zone and amenities for the desired user group, although loan installments must be paid. However, the site's slopes and severe rainfall offer a landslide risk, requiring strong structures. This initiative intends to build safe, cheap homes for the urban poor while considering site environmental issues. Climate-resilient, comprehensive, low-cost housing is suggested in this conference report. It encourages women's empowerment, micro-businesses, and self-sufficient communities while considering geography. The study uses qualitative and quantitative top-down eco-adaptation. Eco-friendly design, affordable sustainable resources, and ecological equilibrium are studied. The results reveal that architectural interventions can address community dynamics, risks, and environmental challenges throughout development. Strategies and policies support these activities. The garment industry, day labor, sharecropping, microbusinesses, and fishing support Pahartali's urban poor, according to socio-demographic data. Urbanization and deforestation landslides undermine community ownership. The concept includes site selection, design, infrastructure, community engagement, and sustainable urban poor housing funding. This technique addresses overcrowding, eviction, water shortages, and poor services. The analysis shows that rising nations with moderate slopes and landslide problems need cheap housing. Sustainable urban poor housing with micro-business zones, communal gardens and integrated farming. This enhances living conditions and economic and social progress in these communities. The housing proposal eliminates landslide risks, protects the environment, and provides low-cost, community-centered housing for the underprivileged.

ABSTRACT

Sandplay is a creative form of therapy to work with children in a nonverbal manner. Sandplay therapy helps the person develop social skills and act as a therapy method where they can reflect and repair their inner world. Today, sand therapists perform sandplay therapy on different children, but this and similar therapy methods are generally performed in closed rooms and places. The aim of this study is to test the feasibility of sandplay therapy method in an open area for children with ASD and investigate its effect on the development of social skills. In addition, the reorganization of sandplay areas where children with disabilities receive education and treatment, and the introduction of design proposals for integrating them with sandplay therapy in the open area, have been one of the other objectives of this study. Experimental group in this study consisted of 2 children with Asperger's Syndrome (a type of autism) and individual sandplay therapy work was carried out in the open area. The effect of open area sandplay therapy method on the development of autistic disabled people was compared with the values taken before and after the sandplay therapy sessions. The findings revealed that increasing interaction with the society contributed to the development of children with ASD socially and psychologically. In addition, the development of suggestions for the design of barrier-free sandplay areas and the evaluation of the connection between sandplay therapy and design in the open area were made.

ABSTRACT

It is expected that autistic people who need Special Education and Rehabilitation Centers will socialize, strengthen their weaknesses, gain self-confidence, and show mental and physical development thanks to these centers. These people need sensory gardens specially designed for them to improve psychologically and physically and to participate in society. Therefore, in special education and rehabilitation centers, sensory gardens designed with the user group in mind are required in order to support the recovery of children with autism and to increase their sensory stimuli. The aim of this study was to plan the close environment of IFSER as a sensory garden for children with autism and to develop a design proposal in this direction. The working process consisted of field survey and analysis, determination of user requests and needs, and development of a sensory garden design proposal. In addition, the plant and structural design features of the study area were evaluated in terms of landscape design, thanks to the interviews with the center staff. The usability of the outdoor conditions of this center by children with disabilities was examined. According to the examples of sensory gardens and the data obtained, there are no sensory garden designs in Türkiye. In Türkiye, the Park and Garden Directorates of the relevant municipalities and the Ministry of Environment and Urbanization should consider the sensory aspect while designing the disabled gardens, especially for autistic children.

VIETNAM'S POLICY ON CO₂ EMISSIONS IN THE CONTEXT OF ACCESSING INTERNATIONAL AGREEMENTS

Dr. Minh Le Thi (ORCID: 0000-0003-0156-4046)

Thu Dau Mot University, Faculty of Management Science

Email: minhlt@tdmu.edu.vn

ABSTRACT

Participating in the international market through bilateral and multilateral FTAs contributes to Vietnam's outstanding achievements in economic development. However, high economic growth also causes Vietnam to emit a large amount of CO₂ into the atmosphere. Reducing CO₂ emissions in the context of trade opening is a matter of particular importance, having significant influence, interacting, and deciding the country's sustainable development; is the basis and premise for making guidelines and policies for socio-economic development, ensuring national defense, security, and social security. The article presents the situation of CO₂ emissions in Vietnam over the years. At the same time, the report studies Vietnam's policy related to CO₂ emissions. On that basis, the paper proposes some recommendations related to the implementation of policies on CO₂ emissions. This article is based on: (i) an Analysis of documents, reports, and data on the situation of CO₂ emissions in Vietnam by Vietnamese state agencies and research agencies such as the Ministry of Natural Resources and Environment, School, National Center for Socio-Economic Information and Forecast (under the Ministry of Planning and Investment), Steering Committee for the Implementation of the United Nations Framework Convention on Climate Change, and the Kyoto Protocol in Vietnam; (ii) Legal reports, research articles in relevant journals, and the Internet; (iii) Legal documents issued by competent state agencies of Vietnam related to environmental protection in general and greenhouse gas emission reduction in particular.

Email: ptplinh@ctu.edu.vn

ABSTRACT

Can Tho is a province in the Mekong Delta. This is a land (plain) with many rivers, so commercial activities taking place on the river take place widely and form a floating market system. Floating market is a special type of market, trading activities in the market take place on the river and attract many people to buy and sell. Products traded at the market are mainly fruits, vegetables and agricultural products. Commercial activities taking place on the river have made an important contribution to the formation of a special culture, floating market culture. This cultural form reflects the geographical specificity and richness of the Mekong Delta in agricultural production. Floating market culture in Can Tho also has important values in tourism development in the Mekong Delta in general and Can Tho in particular. Currently, Vietnam is implementing many solutions to preserve and promote the cultural value of the floating market in Can Tho. This study is carried out by the method of cultural research, actual survey, analysis to have appropriate research content, thereby clarifying the cultural content of the floating market in Can Tho, contribute to the study of culture in the Mekong Delta and Vietnam.

THE ROLE OF BLOCKCHAIN TECHNOLOGY IN PROMOTING CIRCULAR ECONOMY DEVELOPMENT

Mr. Nguyễn Khánh Hùng
Thu Dau Mot University, Vietnam
hungnk@tdmu.edu.vn

Mr. Huỳnh Minh Quân
Sai Gon University, Vietnam
hmquan@sgu.edu.vn

ABSTRACT

Blockchain technology can play a significant role in promoting circular economy development by enhancing transparency, traceability, efficiency, and trust in supply chains and resource management. The circular economy aims to minimize waste, promote sustainable consumption, and maximize the lifespan of products and materials. The objective of studying the role of Blockchain technology in promoting circular economy development is to comprehensively assess and understand how Blockchain can contribute to the principles and goals of the circular economy. This study aims to explore the various ways in which Blockchain technology can enhance transparency, traceability, efficiency, and trust within supply chains and resource management, ultimately advancing the transition towards a more sustainable and circular economic model. Methods adopted: Analytical and synthesis methods are essential for conducting comprehensive research on the role of Blockchain technology in promoting circular economy development. These methods involve breaking down complex concepts into manageable parts (analysis) and then combining those parts to form new insights and perspectives (synthesis). Main findings: The main findings of a study on the role of Blockchain technology in promoting circular economy development would encompass a range of insights and conclusions derived from the research. These findings shed light on how Blockchain can advance circular economy principles and practices effectively. These collectively contribute to a comprehensive understanding of how Blockchain technology can effectively promote circular economy development by enhancing transparency and traceability; improved resource management; promotion of sustainable consumption; facilitation of circular supply chains; mitigation of counterfeiting and fraud; economic benefits and cost savings; environmental impact and sustainability. Conclusions: While Blockchain technology offers considerable potential to influence the promotion of the circular economy model positively, its successful implementation in a circular economy requires collaboration, standardization, and consideration. Carefully consider technological, economic, and social factors. In addition, addressing challenges such as scalability, energy consumption, and interoperability will be critical to realizing the full benefits of blockchain in promoting the development of a circular economy.

BIM-SUPPORTED CROSS-CURRICULAR FACILITIES MANAGEMENT TRAINING FOR AEC STUDENTS

Prof. Dr. Salih Ofluoğlu (ORCID: 0000-0002-3185-8275)

Antalya Bilim University, Faculty of Architecture, Department of Architecture,
Antalya-Türkiye

Email: salih.ofluoglu@antalya.edu.tr

ABSTRACT

The operational phases of a building's life cycle are often overlooked in AEC (Architecture, Engineering, Construction) education, which typically focuses more on the design and construction phases. New government policies and building information management standards increasingly place an important emphasis on a building's operational aspects. Decisions made during the design and construction phases can directly impact the operation and maintenance of a building. This study presents a cross-curricular educational method for teaching BIM-integrated facilities management (FM). This method emphasizes the connections between different requirements and promotes a holistic view of knowledge. In this educational paradigm, teaching is interdisciplinary, with course topics distributed across the curricula of two courses, and students from two different universities work together to create models for the design, construction, and operational aspects of a building. During this process, students work on their projects with the end goal in mind from the beginning. Building Information Modeling (BIM), an increasingly widespread project production method is used to facilitate collaboration and FM-related requirements. The study also included a survey questionnaire to assess the teaching methodology's effectiveness, the significance of integrating BIM-FM, and the learning experiences of students. According to the survey results, this education raised awareness among AEC students about FM requirements, thereby fulfilling this demand in the design and construction processes.

ABSTRACT

The number of architectural and civil engineering faculties has been significantly growing as a result of the several new universities that have emerged in Türkiye and the Turkish Republic of Northern Cyprus in recent years. It is crucial to integrate project and construction management courses into the curriculum of architects and civil engineers in accordance with this progress. Postgraduate programs in project and construction management offer the training required to become project and construction managers for the construction industry. This research paper intends to examine the past and present conditions, update them, and investigate postgraduate programs in project and construction management in Türkiye and the Turkish Republic of Northern Cyprus. It also serves as a reference for researchers on this subject. Although comparable research has been done in Türkiye, the Turkish Republic of Northern Cyprus was included in the study because there hasn't been any research done there. In order to accomplish this, the second section provided a historical overview of the history of project and construction management. Project and construction management postgraduate programs were investigated and researched in the third section. The current state of postgraduate programs in project and construction management was described in the fourth section. Seventeen common headings were established in order to compare the information in the postgraduate programs. Information for each postgraduate program was specified under the common headings, and charts based on this information were created. Postgraduate programs in project and construction management were assessed in the fifth section, and the findings were presented.

ABSTRACT

*(Architectural) representation, a tool of expression, can act as a language with various techniques. The fact that representation is constructed to reach a consensus on what is represented strengthens its resemblance relationship with language. For this reason, each architectural representation tool (plan, section, perspective, and so on) establishes its own information frame. A trained eye can easily understand what is represented while staying within these knowledge frameworks. On the other hand, this study deals with the forms of representation in which the said frames are resolved and focuses on the problem of wrong that emerges with these breaks. The question of the study is as follows: "Can there actually be a potential that is wrong in the architectural representation/drawing?" In this context, sections from the 2009 animated movie *The Secret of Kells*, directed by Tomm Moore, will be discussed as an example in this study. Mainly images, including sections from architectural spaces, will be utilized. These images will be used to reveal information frames of representation and their refraction forms, and a conceptual reading will be made on the problematic of wrong in (architectural) representation. At the end of the study, the creative areas and different perception forms of the problematic of wrong will be evaluated.*

ABSTRACT

One of the main goals of all governments in the world is to keep the unemployment at low levels. However, despite all the efforts made by national governments and international institutions, many states still confront high rates of unemployment. Some of the studies analyzing the impact of labor market regulations on unemployment show that more rigid employment regulations are associated with higher levels of unemployment. Meanwhile, the relationship between business regulations and unemployment has not been extensively examined in the literature. However, some researches that indirectly investigated this link have concluded that a more burdensome business environment discourages small entrepreneurs and large investors, the consequence being an increase in unemployment. Considering these aspects, the present study intends to conduct a statistical investigation of the labor market and business regulations' effects on unemployment in 11 Central and Eastern EU economies during the period 2000–2020. Our results show that, over the entire analyzed sample, neither labor market regulations nor business regulations had any significant effects on unemployment. However, the individual cointegration coefficients showed that market-oriented labor regulations diminished unemployment in Bulgaria, Poland and Romania, but raised it in Hungary, Latvia, Lithuania and Slovenia. Meanwhile, market-oriented business regulations decreased the unemployment in the Czech Republic, Latvia and Poland, but raised it in Croatia and Slovenia.

Keywords: Unemployment, Labor Markets, Labor Market Regulations, Business Regulations, Central and Eastern EU States.

ABSTRACT

*As urbanization continues to transform cities, providing green spaces that not only counteract the concrete environment but also promote residents' well-being has become a significant challenge. In response, the concept of biophilic green roof design has gained prominence as a solution for creating urban oases that reconnect people with nature. This study delves into the practical implications of biophilic principles in green roof design, with a focus on Istanbul's distinctive concrete landscape in the housing context. Therefore, this study investigates how biophilic design qualities can be integrated into green roof designs in Atakent Province, an area characterized by modern housing complexes. The conceptual framework of this study revolves around the use of biophilic design qualities and techniques to enhance architectural ecological quality and individuals' reconnection to modern urban spaces. To investigate the impact of green roofs on individuals' reconnection to nature, a case study was conducted based on the redesign of eighteen rooftops. Through a mixed-method approach, the research compares two independent groups – users of green roofs and concrete roofs—using an independent samples *T* Test to assess respondents' physical comfort and well-being. Accordingly, the findings provide empirical insights into how green roof designs in concrete jungles can positively influence an individual's spatial comfort. By proposing a structured framework to underpin the biophilic green oasis design model, this study promotes a sustainable urban development approach and highlights the importance of the need for the sustainable development of Istanbul's modern cityscape.*

ARCHITECTURAL ANALYSIS OF LATE PERIOD QUARANTINE STRUCTURES IN THE RED SEA: KAMARAN QUARANTINE STATION

Aylin Gazi Gezgin (ORCID: 0000-0003-4008-6251)

Ministry of Culture and Tourism İzmir-Türkiye

Email: aylin.gazi@ktb.gov.tr

ABSTRACT

From 14th century to 20th century quarantine structures were established in order to prevent spread of contagious diseases. In particular, quarantine structures were established in port cities or on islands for isolation, disinfection or treatment. In 19th century quarantine councils were established and many international sanitary conferences were held in which quarantine regulations and conventions were discussed. After the cholera epidemic in 1865, at the International Sanitary Conference held in 1866, it was decided to establish a quarantine structure near the entrance of the Red Sea for regular monitoring of Muslim pilgrims and maritime transport. By considering its location and physical characteristics, Kamaran island was chosen as a location to construct the quarantine station. This research focuses on one of the largest quarantine structures built in 19th century as the Kamaran quarantine station that has not been adequately addressed in the literature by means of architectural perspective. This study tries to find answers to the questions of how the local architecture reflected to the buildings of Kamaran quarantine station, whether it is affected or not by quarantine structures that have been built before, and what are the effects of quarantine regulations and conventions on the architectural structures of the station. By answering these questions, architecture of Kamaran quarantine station was defined in terms of settlement layout, function, construction technique and material of buildings and infrastructure applications.

ABSTRACT

The Amsterdam School is an architectural style that began to emerge in the beginning of the 20th century in the Netherlands. The general characteristics of this movement are distinctive brickwork, decorative components and a successful blend of traditional and modern elements. The rise of heavy industrialization and mass production, lead a group of architects and artists to seek a new approach on architecture that embraces the values of craftsmanship, individuality and nature. The facades of the buildings were distinctive in the use of traditional materials, brickwork patterns, dynamic sculptures and floating forms. Many of these forms and techniques were heavily influenced by the Indonesian traditional architecture and crafts, as a result of the exclusive interaction between both cultures during the Dutch colonialism. Another important goal was to integrate the interior and the exterior spaces and to create a harmony between the architecture, the environment and the interior elements, ranging from furniture to tableware. The Amsterdam School architects believed that people who lived in beautiful homes become beautiful people, and ordinary men should have access to arts. The movement also had a significant impact on Dutch social housing while there was a growing need for affordable housing in Amsterdam. The architects came forward to design houses for the working class, that demonstrated the School's design principles by merging functionality and beauty.

ABSTRACT

For years, the art of cinema has been creating visually captivating and emotionally compelling atmospheres for its audience by employing various color schemes. The psychological use of colors in cinema, similar to lighting design, aims to direct the audience's emotional responses towards the film and enhance its aesthetic value through the visuals created. This study follows a semiotic approach, using the color factor both to enhance aesthetic value and to interpret the psychological meanings of spaces. It analyzes the colors used in film examples from the history of cinema to create a code and conducts spatial analyses specific to the film "Lara." Additionally, the study explores the connection and parallelism between the created atmosphere in the film and Picasso's artistic periods. The color factor, a significant element in the film's visual language, is used to enhance the emotional impact of the story. The director divides the film into three color schemes, drawing inspiration from Picasso's Blue, Pink, and Cubist periods, along with the stories behind those periods. As a result, the audience gets to see Lara's emotional states throughout the film in parallel with the colors used in Picasso's periods. In conclusion, the director Jan Ole Gerster's use of color in the film "Lara" (2019) plays a significant role in the film's visual language, almost becoming a separate leading character. The color factor supports the storytelling in terms of character, space, and city narratives, while also defining the boundaries between reality and fiction for the audience, establishing a strong connection with the story and aiding the audience in internalizing it. Overall, the use of color in the film "Lara" is evidence of the power of visual storytelling and the ability of colors to enhance and enrich a film's emotional impact.

ABSTRACT

In this study, it will be discussed whether the data obtained from scientific studies on sensory integration theory can contribute to the sensory relationship we establish with the spatial environment, which is defined as physical space in the literature. The sensory integration theory put forward by occupational therapist Jean Ayres is concerned with the sensory transfer process in the brain. Scientific studies in this field provide a lot of data on the senses, interactions between the senses, and the sense-environment relationship. The strong relationship between the senses and environmental factors is undisputed. The sensory integration literature allows us to obtain some data about the physical environment-sense relationship. In this context, it will be tried to discover at what points the information we obtained from the aforementioned universe intersects with the studies on the concepts of sense-space and multi-sensory space in the literature. In the study, the approaches of Norberg-Schultz, Merleau-Ponty, Pallasma, and Zumthor, who have studies on space and sense as a method, will be brought together and a conceptual reading will be tried on the data and relations of space by crossing the relevant approaches with the sensory integration literature. The aim of the article is to uncover how these various aspects combine to shape our understanding of the spatial environment. In this context, a qualitative methodology will be followed to discuss the reflections of theoretical concepts in space through various space examples. The approach that will be put forward as a result of the study is expected to form a bridge between the multi-sensory space and the sensory integration literature, and it is thought that it can offer a different perspective in this way.

ABSTRACT

The exterior facade of a building acts as the initial point of contact for individuals, affecting their first perceptions of the building's characteristics. These impressions influence one's perceptions of the compatibility of the structure with its historical context, texture, materials, and overall surroundings. The architectural product experiences a process of integrating, where it integrates functional, spatial, symbolic, and semantic characteristics through its interaction with the physical and social environment. The designer's knowledge, cultural background, value judgments, and intended objectives greatly impact this formation. Architecture has a reputation as a medium through which feelings, thoughts, and social principles can be effectively communicated. Metaphors are frequently used as a means of communication within the field of architecture, which has been accepted as a language through which individuals communicate messages to one another via architectural structures. Architects use metaphors as a means of expressing and communicating their designs. While these metaphors can be linked to obvious formal characteristics, they can also have ABSTRACT and concealed connotations. The aim of this study is to investigate the impact of environmental elements and metaphors on the architectural design process, specifically in relation to the development of the architectural envelope. Within this specific context, significant study has been conducted on buildings that utilize metaphorical design approaches. The focus of this research consists in understanding the way in which these architectural structures connect with their surrounding environment and the different meanings they generate.

ABSTRACT

Perception is generated through a combination of external cues and individualized cognitive processes, which occur along a temporal continuous. The spatial component of perception has a complex relationship to the visual sense. Within the field of architecture, the perception of a given environment is influenced by visual perception that is informed by information collected through a systematic and continuous process. Nevertheless, this perception could show variation and experience transformation in accordance with various time periods and individual attributes. The main goal of this investigation is to examine the dynamic and transformative characteristics of perception as it progresses through some factors. The phenomenon of changing and developing perception has the potential to either strengthen a current representation or understanding, or entirely replace it in order to generate an original signification or representation. The main goal of this research is to analyze the aforementioned occurrence in the field of optical illusions, with the intention of examining whether the observed change in perception indicates an actual change in cognitive perception or just an illusion effect. The term 'illusion' has been selected based on its connection to occurrences of misunderstandings, which can be supported by the flexibility and transformative ability of perceptual processes. In summary, the objective of this study is not to provide a conclusive decision, but rather to stimulate more questions. Through an exploration of the area of optical illusions, this study aims to generate alternative areas of investigation and broaden the current discussion.

ABSTRACT

Crowdsourcing is a method that aims to produce solutions by bringing together the knowledge, skills and resources of a community. In architecture, crowdsourcing can be used as a platform where different ideas are collected and evaluated during the project design process. For example, if a new settlement is to be designed for a city, the views and needs of the community must also be taken into account. At this point, different ideas from the society can be gathered by using the crowdsourcing method, and by evaluating these ideas, a design can be realized in accordance with the needs of the society. Thanks to this method, the needs of the society in architectural projects can be better understood and projects can be made more fair and just. Crowdsourcing in education can be used to encourage student participation and knowledge sharing in the learning process. For example, feedback from students can be sought to create or update the content of a course and opportunities for students to develop their own projects and share them with other students. In addition, crowdsourcing in education aims to bring together students' specialized knowledge and skills in different fields. Properly trained architects can produce designs that meet people's needs and increase the well-being of society. For this reason, the use of crowdsourcing in architectural education and the interactive situation of the developing world order can enable future generations to be more conscious and offer more livable environments.

ABSTRACT

Highlighting non-human attributes through the attribution of human characteristics establishes an emotional connection between the user and the product. While the existing literature extensively addresses the practice of personification in relation to branding and marketing terminology, this study uniquely shifts attention towards consumers' autonomy and their intricate emotional engagement with ordinary objects. Employing the Extreme Characters method, a select group of participants characterised by unique associations with specific mundane items were examined. Conducting a semi-structured narrative inquiry approach, the study delved into how these consumers integrate particular objects into their social and personal narratives. Conducted within the geographical boundaries of Türkiye, this study employed a combination of online and in-person dialogues to engage with a demographically diverse cohort of 10 individuals. Among these participants, a subset holds professional roles as product designers. Their backgrounds encompass a range of distinct experiences and expertise, contributing to the multifaceted perspective captured in this research. Of particular significance, the study deliberately excludes the overt impact of conventional marketing techniques on these products, allowing for a more unadulterated understanding of the participants' inherent connections. In conclusion, the research extensively examines the socio-cultural framework and the intricate ecosystem that envelops these non-humans in everyday life of consumers.

ABSTRACT

The nickel electrodeposition process can have a significant effect on various aspects of the deposited coating, including its properties, characteristics, and performance. The parameters and conditions of the electrodeposition process can be adjusted to tailor the coating to specific requirements. Factors like bath chemistry, temperature, agitation, and current density should be carefully controlled and adjusted based on the desired coating characteristics and the specific application requirements. The present work aims to improve the surface properties, hardness, wear resistance and electrochemical corrosion resistance of copper. To this end, the influence of nickel deposition process on the elaboration of thin Ni layers on copper substrate were conducted by CP (chronopotentiometry) at 40 mA/cm² and CA (chronoamperometry) at -1V from watts bath for 10 minutes has been studied. The electrochemical behavior and the corrosion properties of the deposits in 3.5 % NaCl were investigated by means of d.c polarization measurements, open circuit potential and electrochemical impedance spectroscopy (EIS). The surface morphology of nickel deposits were analyzed by optical microscopy and whit light interferometry (WLI). The obtained results shows that the structure of nickel deposits is influenced by the current density. Nickel electrodeposition at -1V leads to an increase in the electrochemical corrosion resistance while the nickel coatings prepared under a processing current density of 40 mA/cm² exhibited the highest cathodic current efficiency, a good surface density, thickness and flatness. Moreover, that nickel deposits elaborated by CP presents a smoother surface with less nodules.

ABSTRACT

In the last twenty years, the availability of river sand has declined, posing challenges for many countries to satisfy their construction needs. Utilizing sea sand for construction has emerged as a solution to address the scarcity of river sand. This research aims to assess the properties of geopolymer paste derived from seawater and sea sand, which have gained popularity due to their abundance, cost-effectiveness, and environmental benefits. The investigation involved creating various geopolymer mixtures by adjusting ratios of seawater, sea sand, and alkaline activators. Results indicate that the geopolymer's compressive strength increased as curing time progressed, with seawater and sea sand playing a significant role in enhancing strength development. Furthermore, incorporating sea sand improved workability and reduced water requirements. Consequently, this study concludes that incorporating seawater and sea sand into geopolymer production offers a sustainable substitute for traditional concrete materials.

ABSTRACT

In this experiment, a facile approach was made to synthesis graphene iron oxide nanocomposites from postharvest field waste of Pennisetum glaucum, an alternate to commercial graphite. They were fabricated by improved green technology using the extracts of Melia dubia and Prosopis juliflora. The composition ratio of iron oxide to graphite oxide have improved not only synergistic effect but also surface area with functionalization, high loading capacity, good conductivity. Various characterization techniques such as UV-visible spectrophotometer, powder X-ray diffraction (PXRD), Fourier transformation infrared spectroscopy (FT-IR), field emission scanning electron microscopy (FESEM), energy dispersion X-ray (EDX and vibrating sample magnetometer (VSM) were performed to check stability, colloidal dispersivity, particle size range, superparamagnetic property. The assay results proved the hemocompatibility of our composites was 5 % and up to 1 µg concentration as a safer dosage from the MTT assay with better biocompatibility. By Two-way ANOVA-balanced design, we observed that results were statistically significant for biofilm inhibition, antioxidant, and biocompatibility activities with a p value (<0.05). Besides, by resonance surface method, the composite yield parameters were analyzed using central composite design. The prepared nanocomposites reported X-ray attenuation potential almost equal to the commercial agents at much lesser dosage and also worked as potential contrast agents for multimodality X-ray-CT/MRI studies with better resolution for prognosis. Thus, our work

ABSTRACT

The application of Titanium Dioxide nanoparticles-chitosan (TiO_2 -Cs) beads in photocatalytic dye reduction is limited due to the photon or mass transfer limits, oxygen defiance, and low photonic efficiency. This is caused by the non-homogenous monodispersed of the TiO_2 -Cs photocatalyst. There is an increasing need to create a cost-effective and high performance of photocatalyst synthesis system. Microfluidic approach may provide a standard platform to overcome the limitations as they enable convenient control of various operating conditions during reaction such as flow rate and heat dissipation. Thus, a microfluidic device which only requires a small throughput for the repetitive testing with highly efficient photocatalyst synthesise system is proposed and simulated using Computational Fluid Dynamic Modelling. A ternary system photocatalyst, gold nanoparticles-loaded TiO_2 -Cs (AuNPs-Chitosan- TiO_2) is proposed and synthesise using the proposed droplet-based microfluidic system to overcome limitation of titanium dioxide (TiO_2) which is the low photocatalytic activities in visible light. The physical properties of the photocatalysts such as interfaces, shape, and light adsorption will be characterised. Besides, computational fluid dynamics (CFD) simulation of photocatalysts droplet formation in 2-dimension cross-junction microchannels were performed using the Volume of Fluid (VOF) method. The effect of control parameters such as the contact angle, the capillary number, the interfacial tension, and the continuous phase viscosity will be investigated. The reaction kinetics and reduction mechanism of the dyes will be studied to correlate on the TiO_2 -Cs and AuNPs-Chitosan- TiO_2 micro-encapsulated photocatalyst and photocatalytic performance separately. A novel design of a microfluidic chip-based photocatalyst synthesise system will be developed and optimized with improvement in efficiency and consistency toward degradation of pollutants in wastewater. It is anticipated that using microfluidic technique with a low throughput will produce a homogenous standard of TiO_2 -Cs and AuNPs-Chitosan- TiO_2 photocatalyst under controlled light radiation, as well as quick iterative testing and optimization of its photocatalytic activities for dyes reduction.

ABSTRACT

Xorides xylotrichi (Hymenoptera: Ichneumonidae) is a specialist parasitoid of walnut stem borer, Xylotrechus stebbingi (Coleoptera: Cerambycidae), a serious pest of walnut trees (Juglans regia) in north-western Himalayas. In the present study we exposed the infested branches to female wasps and studied different parasitoids-host interactions including host selection behaviour, envenomisation, oviposition and larval development. The results demonstrated that wasps develop as solitary parasitoids with host size having a significant effect on the sex determination of the parasitoids. The female wasps utilise specialised sensory structures to located the host for oviposition. The parasitoids were observed to produce three generations in a year and undergo pupal diapause in the month of October with subsequent emergence in may next year. The results of the present study could serve as valuable resource for the successful implementation of biological control against the walnut stem borer.

ABSTRACT

In today's world convivial media has become an integral part of life. Twitter is an American micro-blogging and gregarious networking portal which provides the users a platform to post news, data and celebrations. Twitter has become an essential mode of communication medium during the occurrence of an emergency or disaster. The pervasiveness of perspicacious phones and tablets enable people to pronounce and apprise others of the occurrence of an emergency they are experiencing in authentic-time. This information regarding disasters propagated over the gregarious media can preserve thousands of life by alerting others so that they can take evasive action. Thanks to computer technology. texts uploaded on gregarious media may be relegated predicated on the emotional expressions they contain, making it simple to utilise them to expound and forecast occurrences. Natural language processing (NLP) implements are capable of carrying out this estimation process. In this paper, we utilized several preprocessing strategies, the TF-IDF (Term Frequency-Inverse Document Frequency) feature extraction method, and relegation models to evaluate tweets containing disaster-cognate terms. According to their fl scores. train precision, and test precision, we compared sundry relegation algorithms (SVC, MultinomialNB, LogisticR, XGBClassifier, RandomForest, DecisionTreeClassifier, and KNeighborsClassifier).

ABSTRACT

The objective of this research is to develop and fine-tune a feasible solution for the identification and classification of various bone fractures in the medical field using Convolutional Neural Networks (CNNs) in the scope of modern models such as ResNet, DenseNet, VGG16, and so forth. The study involved performing multiple model fine-tuning attempts for various models, with a focus on achieving a predefined threshold of confidence agreed upon later in this research. The research findings revealed that the classification results were lower than the predefined threshold of confidence. However, the promising results achieved suggest that machine learning and deep learning-based solutions for identifying and classifying bone fractures could potentially replace traditional methods currently employed in the medical field with much better results. The researchers believe that further fine-tuning and the application of more advanced techniques such as Feature Extraction can help improve the accuracy of the model and increase the confidence threshold. The use of CNNs in bone fracture detection is a new approach that has shown promise in recent research. CNNs are known for their ability to learn and recognize complex patterns and features in images, making them well suited for the task of bone fracture classification. However, the development of such models requires a large dataset of labeled images that are representative of the various types of bone fractures. The use of deep learning models such as ResNet, DenseNet, and VGG16 has allowed for the development of more complex models with better accuracy in bone fracture detection. These models have shown improved performance in other areas of medical imaging, and their application in bone fracture detection holds great potential. While the use of machine learning and deep learning-based solutions in bone fracture detection is still in its early stages, the researchers believe that the potential benefits of these methods are significant. The ability to accurately and efficiently detect bone fractures can lead to better treatment planning and management, resulting in improved patient outcomes and quality of life. Furthermore, the use of machine learning-based solutions can help reduce human error in bone fracture detection and provide a more objective and consistent diagnosis. In conclusion, the use of machine learning and deep learning-based solutions for identifying and classifying bone fractures has the potential to significantly improve the accuracy and efficiency of bone fracture detection in the medical field. While further research and development are necessary, the promising results achieved in this study suggest that these methods may eventually replace traditional methods currently employed in the medical field.

ABSTRACT

We are observing that electronic data is generated at a very fast pace. We in the current work are going to utilize one platform of e-content that is news. News is getting electronically circulated all around the world nowadays. In our work what we have done is made a utilization of a programming language called Python. Which is the need of the current era in terms of implementing AI features in the Application. We have made a utilization of the ML approach to get through with the Solution of the Problem posed. Natural Language Processing or NLP is the Technique of AI that is what is utilized in the Conceptual level.

ABSTRACT

Computer Vision is an Emerging area in the Field of Computer Science and Engineering. Cameras are readily available to almost all the people around the globe. The current work is aimed at making the best usage of the available tools and models to solve the problem of theft happening every now and then in almost all the areas. We are in our work devising a system that is going to help is creating an alarm. The work is implemented in Python and makes usage of the best of the Algorithms available for the purpose. We are able to have a very nice accuracy measure in our work. ML is the path finder. We have made a good use of the AI material to go through with the problem addressed.

ABSTRACT

This paper reports the development of resistive nitrogen dioxide sensor, employing a sensing layer based on a binary matrix nanocomposite comprising fluorinated carbon nanohorns (CNHs-F) and reduced graphene oxide (rGO). The sensing device consists of a metallic interdigitated dual-comb structure fabricated on a Kapton substrate the electrodes being made of gold. The width of the electrodes is about 200 microns, with a separation of 6 mm between them. They can be linear or have an interdigitated configuration. The NO₂ monitoring capability is investigated by applying a constant current between the two electrodes and measuring the voltage at different values of the NO₂ concentration to which the sensing layer is exposed. From the point of view of the detection principle, the resistance of the sensitive layer varies with the NO₂ concentration level. The interaction of NO₂ molecules with rGO and CNHs-F can be interpreted from the perspective of the HSAB theory. Both fluorinated carbon nanohorns and reduced graphene oxide. They are p-type semiconductors, conduction mainly through holes. When the sensitive layer is exposed, the physisorbed and chemisorbed molecules of NO₂ (oxidizing gas) will act as electron acceptors, increasing the concentration of holes in both nanocarbonic material and thus leading to a decrease in resistance. Fluorinated carbon nanohorns and reduced graphene oxide give a high specific surface / volume ratio, as well as a variation in the resistance of the sensitive layer upon contact with NO₂ molecules. The new synthesized sensing layer has several significant advantages: detection at room temperature, chemical and thermal stability, superior mechanical properties.

Keywords: Nitrogen Dioxide, Carbon Nanohorns, HSAB, Reduced Graphene Oxide.

ABSTRACT

This paper reports the design and manufacturing processes for a resistive relative humidity sensor, employing a sensing layer based on oxidized carbon nanohorns (SWCNHs)–fullerenol – poly (acrylamide-co-acrylic acid) partial sodium salt ($M_w = 520,000$) ternary nanocomposite.

The interdigitated (IDT) sensing structure was manufactured on a Si substrate ($470 \mu\text{m}$ thickness), covered by a SiO_2 layer ($1 \mu\text{m}$ thickness). The metal stripes of IDT comprised a Cr (10 nm thickness) and Au (100 nm thickness) stack, having $200 \mu\text{m}$ width. 6 mm was the distance between the electrodes. The RH detection capability of the structure was investigated by applying a current between two electrodes and measuring the resistance of the IDT, at different RH levels. The use of the ternary nanocomposite oxidised carbon nanohorns/fullerenol/poly (acrylamide-co-acrylic acid) partial sodium salt will provide a series of significant advantages and enhancements, in comparison with other chemoresistive humidity sensors: a. a high ratio between specific surface and volume. b. a very good detection over a wide range of temperature; c. the hydrophilic character of the sensitive layer can be easily modulated based on the oxidation parameters specific to the method employed (plasma power, nitric acid concentration, reflux time, etc.); d. fullerenol has a pronounced antioxidant character, hydrophilic properties, good compatibility with oxidized carbon nanohorns; Poly (acrylamide-co-acrylic acid) - partial sodium salt, is a hydrophilic polymer that ensures the cohesion of the two nanocarbon materials, being an excellent binder.

Keywords: Oxidized Carbon Nanohorns, Fullerenol, Resistive Humidity Sensor.

ABSTRACT

This paper reports the design and manufacturing process for a new chemiresistive humidity sensor using conductive polyaniline- polyvinylpyrrolidone nanofibers as sensing layer. The RH sensor includes a dielectric substrate, a first electrode and a second electrode disposed above a dielectric substrate and the sensing layer. The electrodes (aluminum, copper, and chromium) are deposited onto the surface of the dielectric substrate through direct printing. Synthesis of conducting polyanilines is performed through doping of emeraldine with Calmagite and sulfonated polyethylene glycol (PEG-SO₃H). The synthesized nanocomposite is deposited onto interdigitated electrodes through drop casting method. These sensing films exhibit some important advantages: -Calmagite contains sulphonic groups that are strong acids according to the Bronsted-Lowry theory and can protonate imine nitrogen atoms in the emeraldine structure with the formation of stable conductive polyaniline; -Due to the large size counter-ion, the polyanilines doped with Calmagite and PEG-SO₃H and are less susceptible to the de-doping; -Due to aromatic skeleton, Calmagite interacts with emeraldine through the π - π stacking interaction, resulting in a more stable structure; - Polyvinylpyrrolidone is hygroscopic, improves the mechanical and film properties of polyaniline; -The synthesis of PEG-SO₃H is facile, from versatile precursors; -PANIs are polymers with good environmental stability, low cost and mature fabrication process. The conductive nanocomposite based sensing layer were investigated by applying a voltage between the two electrodes and measuring the electrical current flowing through the sensitive layer at various levels of humidity.

Keywords: Chemiresistive Humidity Sensor, Polyaniline- Polyvinylpyrrolidone Nanofibers.

ABSTRACT

Formaldehyde is a flammable, colorless gas with a pungent odor, In the indoor environment the most significant sources of formaldehyde are urea-formaldehyde resin and tobacco smoke. It is associated with many health risk factors and has been identified as a major cause of Sick Building Syndrome (SBS). Therefore, in the last years, different types of sensors were developed for monitoring indoor formaldehyde level. This paper reports the development of chemiresistive formaldehyde sensor, employing a sensing layer based on a nanohybrid comprising N- doped carbon nano onions – polyvinylpyrrolidone. The mass percentage of nanocarbonic component in the sensing film varies between 80 and 90. The sensing device consists of a metallic interdigitated dual-comb structure fabricated from Si/SiO₂, the electrodes being made of gold. They can be linear or have an interdigitated configuration. The formaldehyde monitoring capability is investigated by applying a constant current between the two electrodes and measuring the voltage at different values of the formaldehyde concentration to which the sensing layer is exposed. The decrease in conductivity is explained by the fact that coulombian interaction between formaldehyde and N- doped carbon- nanonions disrupts the percolation channels. The new sensing layer has several significant advantages: - N- doped carbon nano-onions ensure a high specific surface / volume ratio, as well as a variation in the resistance of the sensitive layer; - polyvinylpyrrolidone is an effective dispersant for nitrogen-doped onion-type nanocarbon materials;- detection at room temperature; - chemical and thermal stability.

ABSTRACT

The interest for reliable, low-energy consumption and highly sensitive relative humidity sensors increased in the last years due to their usefulness in a wide variety of industrial, commercial, and residential applications such as in HVAC (heating, ventilation, and air conditioning). This paper reports the development of resistive relative humidity sensor, employing a sensing layer based on a fluorinated carbon nanohorns, fluorinated carbon nano-onions and as well as nanocomposites of the type fluorinated carbon nanohorns-fluorinated carbon nano-onions. The RH sensor includes a PET substrate, interdigitated electrodes and a sensing layer obtained via drop casting method. The RH monitoring capability of the sensing layers was investigated by applying a current between the two electrodes and measuring the voltage at different values of relative humidity at which the sensing layer was exposed. The new synthesized sensing layer used in the manufacturing of resistive RH sensor have several significant advantages: -both nanocarbonic materials ensure a high specific surface / volume ratio, as well as a variation in the resistance of the sensing film in contact to water molecules; - fluorine atoms, through the electron-attracting effect, increase the number of carriers both in carbon nanohorns and in onion-type nanocarbon materials. As in both nanocarbonic structures conduction is achieved through holes, the material's sensitivity to water molecules increases; - the presence of fluorine atoms reduces the hysteresis through their hydrophobic effect; - detection at room temperature; - chemical and thermal stability; - superior mechanical properties.

Keywords: Relative Humidity, Fluorine, Carbon Nanohorns, Sensor.

ABSTRACT

Earthen materials have been used since ancient times. Their use in construction has decreased with the development of building materials technology after the Industrial Revolution. Nowadays, earthen materials gain importance as building material that reduces embodied energy and promotes sustainability. They have disadvantages such as low compressive strength and high sensitivity to moisture. To overcome these, the researchers use stabilizers such as lime, cement, fiber, or bitumen. This study focused on natural hydraulic lime (NHL3.5), which there is limited research using as a stabilizer. Two different soils were taken from Elbeyli region, which has many earthen structures in İznik district of Bursa. First of all, the characterization tests of the soil types were conducted in order to determine the appropriate type. As characterization tests, acid and ignition loss analyses, sieve analysis, and XRD analysis were conducted. NHL 3.5 and air lime were used to stabilize the matrix. Two ratios of 6% and 12% binders and two curing conditions, curing cabinet with (23 ± 2 C - $>90\%$ RH) because of using a hydraulic binder and laboratory condition (23 ± 2 °C - $40\pm 10\%$ RH), were investigated. As a result, samples were not disintegrated in water except samples of 6% air lime additives and the control group. The samples containing additives for all curing conditions have better resistance to water except containing 6% NHL 3.5. Air lime additives increased the strength of the samples, while NHL 3.5 decreased slightly. Also, it is seen that the curing cabinet curing decreased the strength of all samples in comparison with laboratory condition curing.

Keywords: Earthen Material, Earthen Block, Stabilization, Natural Hydraulic Lime, Air Lime.

1. INTRODUCTION

Earthen building materials are ancient building materials commonly found in Europe, Asia, Australia, and Africa for centuries. The oldest examples date back to 2000 BC. One of the most critical features of earth-building materials is the use of locally available raw earth in its natural state, thereby reducing the carbon footprint produced compared to other traditional building materials. Despite all these benefits, earthen building materials were used due to limited

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

technological possibilities and regional raw material supply difficulties before the industrial revolution. For this reason, it has been seen as a material that should be abandoned as the welfare level of society increases with the developing technology (Araki et al., 2011; Abhilash, et al., 2022; Kafescioğlu & Gürdal, 1985).

Today, energy consumption is one of the most critical problems in the world. The construction sector has a significant share in environmental damage, consuming more than 40% of the total energy produced globally and emitting more than 30% CO₂ (Directive 2010). The energy spent in the production processes of modern construction materials creates waste after the end of their useful life, the resources used are limited, and the circular economy is negatively affected by the high transportation costs from the factories to the construction site (Boucheфра et al., 2022; Labiad et al., 2022). In recent years, the use of earth as a building material has attracted attention primarily due to its low environmental impact throughout its life cycle. Research shows that using these environmentally friendly materials in the construction industry helps conserve natural resources, reduces pollutant emissions, and increases energy recovery. In addition to being environmentally friendly, they are easy to use, recyclable, regulate indoor humidity and improve the thermal comfort of buildings, leading to their reuse. [(Boucheфра et al., 2022; Labiad et al., 2022; Meddah et al., 2020; Meddah et al., 2020). Various earth construction techniques exist in different parts of the world, such as adobe, mud, earth straw, and compacted earth blocks. Compressed earth blocks are a new method developed to obtain blocks with sufficient mechanical performance by eliminating voids and increasing density. Despite the high compression, high water absorption and crack formation are disadvantages of earthen. To overcome these, scientists recommend using many stabilizers such as lime, cement, fiber, and bitumen [Labiad et al., 2022; Sindanne et al., 2014; Tatane et al., 2018; Meddah et al., 2017).

Soil has been used as a building material since ancient civilizations. On the other hand, Anatolia is among the regions where the early soil structure can be preserved. Çatalhöyük, with its adjoining adobe houses with wooden beams, is a rare example of Neolithic adobe use. The city of Hattusha is an example that reveals the mud brick urban texture. In addition to these, samples of earthen building materials are also seen in critical old settlements such as Aşıklıhöyük, İznik Ilıpınar, Acemköyük, Aslanteppe, Çayönü, Alacahöyük, and Alişar (Kafescioğlu, 2017). Rural settlements have a local and original character with their historical, natural, and cultural structures. New structures are built commonly, or soil architectural heritage items are neglected, abandoned, destroyed, or demolished because the local people do not know the proper maintenance methods for traditional architectural systems. Thus, it reveals the risk of losing the rural heritage that societies have shaped with centuries of accumulation and causes concerns about the survival of these settlements and their transfer to the future. Iznik, on the UNESCO World Heritage tentative list and whose candidacy continues, is a multi-layered cultural center hosting many different civilizations. Iznik is a multi-layered cultural center hosting many different civilizations. Ömerli and İnikli villages are largely preserved settlements that reflect the cultural characteristics of the region. Most of these settlements were built with earth-based materials and traditional adobe architectural construction techniques. Bozyel (2019) researched the protected area of Ömerli village in his master's thesis (Bozyel, 2019). His study determined that 67% of the building stock in there consists of mudbrick structures. Earthen building samples found in the region are given in Figure 1.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 1. a) General view of Ömerli village, b and c) examples of traditional Turkish houses in the village; mud-brick-filled straw structures (Bozyel, 2019)

Seco et al. (2017) determined that the sand content of compressed earth blocks does not have a relationship with their mechanical resistance, which clearly depends on the type of used additive (Seco et al., 2017). 10% NHL 5 additives gave 4.2 times higher compressive strength than the lowest reference value of relevant Spanish Standard. Mkaouar et al. (2019) stabilized compressed earth blocks using several ratios of lime (Mkaouar et al., 2019). It was found that it reached the highest strength by adding 10% of lime. Samples with 10% lime additives have 3.8 times higher compressive strength than control samples. Miqueleiz et al. (2012) used commercial stabilizers such as NHL 5 and CL-90-S to produce stabilized unfired soil clay bricks Miqueleiz et al. (2012) When the CL-90-S additive dosage limit exceeds 6-9%, there is no effect of adding more additives. However, the strength of samples with NHL 5 additives increased when NHL 5 dosage was increased. Barbero-Barrera et al. (2020) investigated the stabilization of compressed earth blocks with NHL 2 and NHL 3.5 additives (Barbero-Barrera et al., 2020). The results showed mechanical strength increased when NHL 2 and NHL 3.5 additives increased. However, mechanical performance dropped higher dosages when NHL 3.5 dosage exceeded 6% due to the low relative humidity curing conditions (Table 1).

Table 1. Summary of studies in the literature.

Additives	Curing conditions	Results	References
4%, 6%, 8%, 10 % Lime	28 Days in drying oven at 60 °C	It reached the highest strength by adding an optimum quantity (10%) of lime. Lime addition reduced the ability of compressed earth to absorb water and the density increased	Mkaouar et al., 2019
3%, 6%, 9%, 12% NHL2- NHL3.5	28 days curing at room temperature (20°C and 50% RH)	The results showed mechanical strength increased when NHL 2 and NHL 3.5 additives increased. However, mechanical performance dropped higher dosages when NHL 3.5 dosage exceeded 6% due to the low relative humidity curing conditions.	Barbero-Barrera et al., 2020.
3%, 6%, 9%, 12%, 15%, 18% NHL5 Calcareous hydrated	1, 7, 28, 56 and 90 days in moisture chamber covered with polythene sheeting to prevent further moisture loss	Samples with NHL 5 additive have better strength than samples with CL-90-S additive.	Miqueleiz et al., 2012

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

Lime (CL-90-S)

10% NHL5

28 Days at 20°C and 100% RH

The sand content of samples does not have a relationship with their mechanical resistance, which clearly depends on the type of used additive. NHL5 got values between 4.4 and 5.5 MPa which overcomes 1.3 MPa, the lowest reference value allowed in the Spanish Standard

Seco et al., 2017

This study analyzed soils belonging to the Elbeyli region, located in the Iznik district of Bursa. Then the soils were separated from the residues and sieved. Earthen blocks were prepared with the soil selected in the preliminary study. Natural hydraulic binders (NHL3.5) and air lime were investigated to stabilize the earthen blocks. The aim of this study is that improve the matrix of the earthen materials by adding sustainable additives such as air lime and natural hydraulic lime. Thus, it is aimed to increase the water resistance of the earthen material, which is sensitive to water, and to increase its mechanical performance.

2. MATERIALS and METHODS

This study evaluates the use of lime-based binders to increase the matrix performance in earthen materials. The experimental study consists of two parts. The first part is about to characterize soil. The second part consists of the production, curing, and physical and mechanical tests of earthen blocks. For the research, earthen samples were prepared with additives, moderately natural hydraulic lime (NHL 3.5), and air lime (Figure 2).

Figure 2. Earthen samples.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Two ratios of binders, 6% and 12%, and two curing conditions, curing cabinet with (23 ± 2 °C and $>90\%$ RH) and laboratory condition (23 ± 2 °C and $40\pm 10\%$ RH), were investigated. A curing cabinet was used to determine whether the hydraulic additive would increase the effect on the mixture compared to curing under laboratory conditions. The samples cured in the curing cabinet were kept in laboratory conditions a day before the test. Experimental workflow is given the Figure 3.

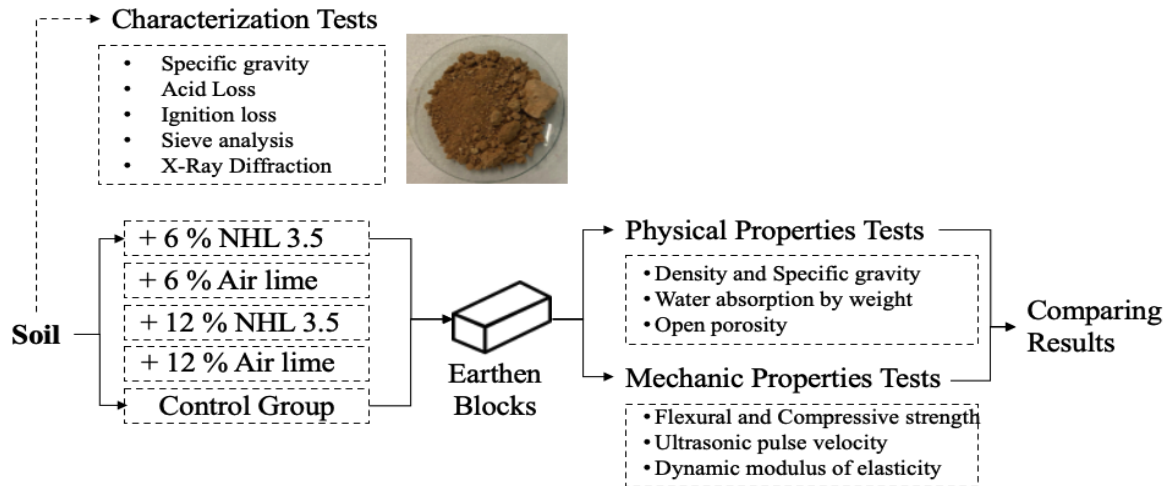

Figure 3. Experimental workflow in the present study.

2.1. Materials

The soil used in this study was obtained from the Elbeyli region, located within the borders of the Iznik district of Bursa province (Figure 4). The soil has been tested for specific gravity, chemical analyses (acid loss and ignition loss) and sieve analysis. In addition, X-ray diffraction analysis was made for the mineralogical composition of the soil.

Figure 4. The soils used in this study that obtained from the Elbeyli region.

Moderately natural hydraulic lime (NHL 3.5) and air lime were used to stabilize earthen blocks. NHL 3.5 is a cement-free binder material with high water vapor permeability, providing breathability. This binder has benefits such as being economical, low energy consumption, and low CO₂ emission during production (Lubelli et al., 2011). Natural hydraulic lime was used in

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

historical mortars. In addition, it is preferred for repair works and in cases where early strengthening is required (Lanas et al., 2004). The raw material of hydraulic lime usually consists of calcium carbonate (CaCO_3), silica (SiO_2), clay minerals (hydrated aluminosilicates), and iron oxide (Fe_2O_3). The raw material is calcinated at low temperatures, approximately $900\text{ }^\circ\text{C}$. Then, the clinker is slaked. The main hydraulic phase is C_2S (dicalcium silicate, Belite) for natural hydraulic lime [20]. Air lime is produced by calcining of limestone (CaCO_3 or $\text{CaMg}(\text{CO}_2)_2$) at approximately $900\text{ }^\circ\text{C}$ (1) and slaked with water (2). Air lime becomes carbonated by hardening with air (3). Natural hydraulic lime and air lime used in this study were commercial products.

2.2. Production of Earthen Blocks and Curing

The manufacturing process of earthen blocks involves several steps, including removing roots and leaves residues, drying, sieving, and mixing with binder and water by hand. Once the mixture was ready, it was placed in a mold and compacted by hand to form $40 \times 40 \times 160\text{ mm}$ samples (Figure 5).

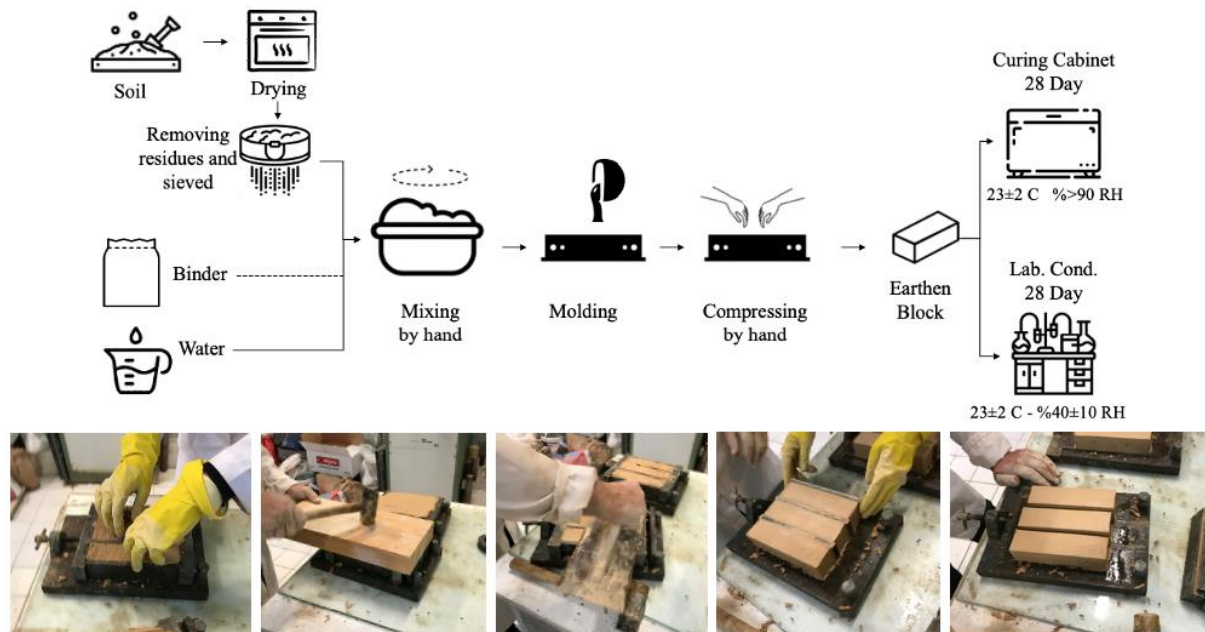

Figure 5. Production process of earthen samples.

The control group was produced using only soil and water. Samples were subjected to two different curing conditions for 28 days in the curing cabinet with ($23 \pm 2\text{ }^\circ\text{C}$ and $>90\%$ RH) and laboratory conditions ($23 \pm 2\text{ }^\circ\text{C}$ and $40 \pm 10\%$ RH). Sample codes, mixing ratios of ingredients by dry weight, and curing conditions are shown in Table 2.

III. International Architectural Sciences and Applications Symposium

3. RESULTS

The results of the study were examined under two separate headings which are soil characterization tests and tests on stabilized earthen blocks.

3.1. Soil Characterization Tests

Soil taken from Elbeyli contains 75-80% Calcite, <5% Quartz, 15-20% Smectite, <5% Chlorite-Kaolinite, <5% Britholite according to the X-ray diffraction analysis (Figure 6).

Figure 6. X-ray diffraction pattern of soil.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Specific gravity, acid loss, and ignition loss of soil are 2.57 gr/cm^3 , 72%, and 33% respectively. The amount of oven-dry soil was weighed and added to a beaker. Then water was added, washed, and filtered to remove clay. Sieve analysis was performed on the aggregates remaining in the beaker. Sieve analysis is given Figure 7.

Figure 7. Sieve analysis of soil.

Before the soil samples were prepared, a minimum amount of water that provided suitable consistency was determined. For this, 150 g of soil in oven dry was taken into a container. Then, water was added and controlled, and paste of suitable consistency was prepared. The amount of water added was noted when it reached the consistency ideal for compaction by hand ramming. A stiff and non-sticky paste was taken care of to determine the minimum amount of water. The minimum mixing water ratio was 23%.

3.2. Stabilized Earthen Blocks

Experiments were carried out to determine the density, specific gravity, water absorption under atmospheric pressure, and open porosity according to TS EN 1936 (TSE Standards Publications, 2007). It was determined flexural strength and compressive strength according to BS EN 196-1 (BSI Standards Publications, 2016) ultrasound velocity according to TS EN 14579 (TSE Standards Publications, 2006). and dynamic elasticity module according to TS EN 14146 (TSE Standards Publications, 2014). Water is one of the most destructive factors for earthen-based materials that are not burning at high temperatures. Therefore, it is very important to increase the resistance to water while improving the mechanical properties of the earthen material.

When lime-based additives are added in the mixture the pH value is up to about 12.4 because of the presence of OH^- ions from the lime. The high pH of the mixture causes pozzolanic reactions between the Si and Al that form part of the clay matrix and the available Ca^{2+} from lime. Pozzolanic reactions provide that occur Calcium Silicate Hydrate (C-S-H) and Calcium Aluminate Hydrates (C-A-H) gels that are responsible for improving the mechanical and physical properties of earthen blocks [16]. The physical test results are given in Figure 8.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

n.d. = not measured

Figure 8. Physical tests results.

Physical property determination experiments could not be completed because samples containing 6% NHL 3.5 and samples (S/6N/LC and S/6N/CC) belonging to the control group (S/C/LC and S/C/CC) without binder dispersed when exposed to water. Among the samples that can be evaluated, it is seen that the sample with the lowest water absorption rate belongs to the mixture containing 12% NHL 3.5 and curing laboratory conditions. The mechanical tests results are given in Figure 9.

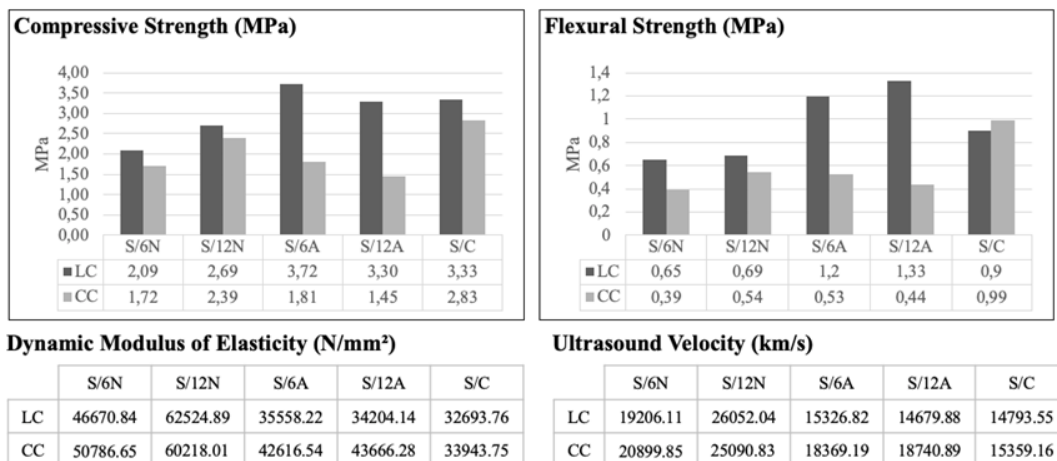

Figure 9. Mechanical tests result.

According to the results, the matrix, which is aimed to be developed by adding NHL 3.5, shows weak characteristics compared to the control group in mechanical aspects. While the samples containing 6% and 12% air lime were more durable than the control group in both compressive strength and flexural strength, however, this only applies to specimens cured in laboratory conditions. The data obtained as a result of both evaluations of the samples cured in the curing cabinet is lower than the control group.

4. CONCLUSION and SUGGESTIONS

This study, which is a preliminary study, gives an idea in terms of developing the matrix in the earthen building materials. The traditional soil materials disperse in water. Increasing water resistance is critical. Samples with 6 and 12% air lime and 12% NHL3.5 additives were not dispersed in water. Additives increased the water resistance of the samples. Samples with 6 and 12% air lime and 12% NHL 3.5 additives had quite similar water absorption rates. Samples with 6% air lime (S/6A) additive had the highest compressive strength. Properties are affected by curing conditions. It is seen that samples that were cured in the curing cabinet had lower mechanical strength than samples that were cured in laboratory conditions. However, samples containing NHL 3.5 were not significantly affected by the curing conditions. It is thought that the samples coming out of the curing cabinet were tested without losing enough moisture. Long-term (3 and 6-month ages) tests need to be carried out to understand the effects of additives better because the pozzolanic reactions in the mixture continue to occur over time. It can be improved physical and mechanical properties by adding different additives and/or fibers in earthen blocks. Also, it is suggested that oven curing is tested to simulate sun drying.

ABSTRACT

*In recent years, the construction industry has become more aware of the adverse impact of particular materials on the environment and human health. This has led to a growing trend towards using bio-based products that align with circular economy and sustainability principles. In addition, there has been a push towards extending the lifespan of construction materials and promoting recyclable options to reduce post-use waste and carbon emissions. Despite the widespread use of synthetic polymers in construction, these materials are known to cause harm to the environment and resource scarcity. As a promising alternative solution, biopolymers have emerged, with mycelium-based composites (MBC) being a particularly innovative and naturally sourced material that can be used in construction. While there has been a growing interest in MBC within academic studies, more information regarding production processes is often needed. Therefore, this study aims to determine the production procedure for MBC by testing specific mixing ratios and production procedures for MBCs, which do not have a standard production procedure, in light of the information in the literature. After determining the mixing ratio and production procedure, MBCs were produced by growing *Pleurotus ostreatus* on different substrates. Basic physical and mechanical properties determination tests were applied to the produced samples. As a result, the standard production procedure and mixing ratios were determined, and the effect of the substrate on the composite was revealed.*

Keywords: Biopolymers, Mycelium-Based Composites, *Pleurotus Ostreatus*, Sustainability, Innovative Building Materials.

1. INTRODUCTION

The consumption of natural resources and the accumulation of waste by plastics produced from petroleum based sources cause a global environmental crisis. The construction sector has an important share in this crisis. According to the report prepared by the United Nations, 38% of

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

global CO₂ emissions from energy consumption originate from the construction sector. The main reason for these environmental problems is that the production of the material to be used, which is from the cradle to the grave, is taken from the natural source, processed, and released directly to the ecosystem after being used. Instead, by adopting a circular economy model, the waste of a material that has completed its useful life should be transformed into the substrate of another process, and the waste should be disposed of and reused (Udayanga & Miriyagalla, 2021; Mohseni et al., 2023). In this context, the construction sector should reduce the production of non-renewable building materials and achieve sustainable practices and circular economy targets by making significant changes. For this reason, cooperation in biotechnology and building materials gains importance for sustainable material production (Girometta et al., 2019).

In recent years, it has been seen that it is possible to create alternative materials to petroleum based resources used in the construction industry with mycelium-based composites (MBC) (Ghazvinian et al., 2019; Maximino et al., 2020). Fungi are microorganisms that have vital roles as important decomposers in natural ecosystems, in addition to their industrial, food, and medicinal applications (Blackwell, 2011; Hyde et al., 2019). The mycelium consists of fibrous filaments called hyphae, which can be defined as elongated cells, mainly composed of chitin, glucan, and proteins Attias et al., 2020; Etinosa et al., 2019; Haneef et al., 2017). The hyphae have a filamentous appearance. Hyphae spread throughout the substratum or an artificial medium represent the main component of fungal biomass, which absorbs the nutrients necessary to grow a fungus's mycelium. The unique structure and composition of its mycelium have made it a suitable source of natural composite materials with adjustable and well-ordered structural and mechanical properties. This biomaterial or composite is grown rather than fabricated (Udayanga & Miriyagalla, 2021; Maximino et al., 2020). It acts as a natural binder by feeding with any organic substrate around it to form an ultra dense filament network (Elkhateeb & Daba, 2019; Heisel et al., 2017). These materials, produced from mycelium, have several important advantages over traditional synthetic materials, including low cost, low density, environmentally friendly nature, and energy consumption (Jones et al., 2020; Zou & Gao, 2020).

All these advantages increase the interest in studies on MBCs. However, although there are various academic studies on its production, there is no standard production procedure and more information is needed about the production processes. Therefore, this study aims to determine the production procedure for MBCs by testing specific mixing ratios and production procedures for MBCs that do not have a standard production method in the light of the information in the literature. After the mixing ratio and production procedure were determined, MBCs were produced by growing *Pleurotus ostreatus* on different substrates. Basic physical and mechanical properties determination tests were applied to the produced samples. As a result, the standard production procedure and mixing ratios were determined and the effect of the substrate on the composite was revealed.

2. MATERIALS and METHODS

In this study, which was carried out to determine the production of MBCs and its use in buildings, first of all, preliminary tests were started based on the information obtained as a result of the literature review in order to determine the mixing ratios and production conditions to be used in the production of MBCs which do not have a certain standard. As a result of the

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

preliminary tests, the first mixture ratio to be used and the required growth time for the sample were determined. Then, MBCs were produced with various substrates in the determined ratios and conditions, and some physical-mechanical property tests were carried out on these samples.

2.1. Determination of Mixing Ratio and Incubation Time

This study used *Pleurotus ostreatus*, which was previously inoculated with oat bran and stored in the freezer. The mycelium was purchased from a specialist firm. *Pleurotus ostreatus* and straw were prepared with the mixture ratios of two different studies, and all other stages related to the production processes were kept constant. Thus, it is aimed to observe the effect of mixing ratios on composite formation. Information on the reference studies and mixing ratios are shown in Table 1. As a result of the relevant production stages, mycelium growth in the prepared samples with the prepared mixture ratios was examined in 7-day periods. As a result of the observations, while no mycelium growth was observed in the experiment with mixing ratio number 1, it was observed that the mycelium growth in mixture number 2 increased gradually as a result of 7-day periods.

Table 3. Mycelium composite mixing ratios of reference studies.

No	Mycelium	Raw Material	Reference
1	50	200	15
2	100	200	16

Table 2 shows the growth observation of samples with different mixing ratios. As a result of these observations, it was decided to continue the studies based on the mixing ratios of experiment number 2.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

The literature has various information about the incubation time required for MBC formation. In order to determine an incubation period, the relevant physical and mechanical property tests were performed on the samples with 14, 21, 28, and 35 days incubation times. Information on the tests performed, and the standards used are given in Table 3.

Table 5. Tests and standards used.

Test	Standard
Water Absorption Under Atmospheric Pressure	BS EN 1936
Flexural Strength	BS EN 196-1
Compressive Strength	BS EN 196-1

The data obtained as a result of the experiments are given in Figure 1.

Figure 5. Test results.

Based on experimental data, it was found that samples aged 28 days and 35 days had similar characteristics. Notably, the mycelium growth in the 28-days samples covered the surface,

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

indicating that growth had reached completion. As a result, it was determined that the ideal incubation period for MBCs for future studies should be 28 days.

2.2. Preparation of Composites With Various Contents

Pleurotus ostreatus was mixed with 16 different substrates using the ratio and incubation time determined as a result of the preliminary studies. Investigations were made to determine the most efficient mixture component. Within the scope of this research, rice husk, straw, rice husk powder, beech shavings, walnut shell, oat, coconut shell, hemp fiber, banana peel, banana tree fiber, textile waste, corn husk, corn cob, okra husk, pulp, and chestnut bark were used as substrate to be added to the mycelium. The selection of substrates required for the nutrition of the mycelium was determined by considering the studies in the literature and rapid supply conditions. In addition, in the choice of substrates to be added to the mixture, care was taken to ensure they were waste materials. The materials used as substrates differ in size and in terms of the cellulose, hemicellulose, and lignin ratios they contain.

While the mycelium is growing, each surface to be used is sterilized with 70% ethanol in order to prevent bacteria induced mold growth. Mycelium, previously inoculated with oat bran, was manually dissected in a container and mixed with sterilized substrates. The mixture was mixed until it reached a homogeneous consistency. The prepared mixture was left to grow for 7 days in micro perforated bags specially produced for fungal growth in order to create a free growth environment. The incubation environment for MBCs is completely dark, adjusted to 80±5% relative humidity and 24 °C. At the end of the first 7-day period, the mixtures in the bag were poured into a sterile container, crushed and mixed until the resulting whiteness dissipated. The mixture was then sterilized and allowed to grow in molds with dimensions of 40x40x160 mm, covered with stretch film. After the molding process, the mold was covered with stretch film and holes were drilled on it for the sample to breathe. All samples left to grow in the mold were removed from the mold after 7 days. This process is important in order to ensure equal growth of the mycelium on every surface. The samples, whose growth time was determined as 21, 28 and 35 days, were placed back in the growth medium. The samples that completed their growth periods were exposed to heat treatment at 100±5 °C for 45 minutes in order to stop the mycelium growth inside. This process is important in order to put an end to the active growth of mycelia. Other samples were taken from the growth medium according to the planned periods of 21, 28 and 35 days and heat treatment was carried out at 100±5 °C for 45 minutes. The produced MBCs content and the mixing ratio information are given in Table 4.

2.3. Experimental Studies

In this section, the physical and mechanical property determination tests applied to determine the basic properties of the MBCs are discussed.

2.3.1. Physical Property Tests

Tests were carried out to determine MBC's dry density, moisture content, and water absorption rate.

Dry density was calculated by the ratio of oven-dry mass to volume based on ISO 9427 (ISO 9427, 2003). Three samples were used for each mixture in the experiments, and the average of the measurement results was taken. Dry density was calculated using formula 3.1.

$$p = \frac{m}{b_1 \cdot b_2 \cdot t} \times 10^6 \quad (3.1)$$

m: is the mass of the test piece, in grams (g).

b1 -b2: are the width and the length of the test piece, in millimetres (mm), (b1 = b2).

t: is the thickness of the test piece, in millimetres (mm).

The moisture content calculation is based on ISO 16979 (ISO 16979, 2003) Measurements were calculated using formula 3.2.

$$H = \frac{m_0 - m_1}{m_1} \times 100 \quad (3.2)$$

m₀: is the initial mass of the test piece, in grams (g).

m₁: is the mass of the test piece after drying, in grams (g).

Water absorption rate measurements by weight were made according to BS EN 1936 (2006) Three samples were used for the experiments and the water absorption rate was calculated using the formula 3.3.

$$a_s = \frac{m_s - m_d}{m_d} \times 100 \quad (3.3)$$

a_s: water absorption (%) by weight at atmospheric pressure.

m_d: mass of the dry specimen, in grams.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

m_s : mass of the saturated specimen, in grams.

2.3.2. Mechanical Property Tests

The compressive and flexural strengths of MBCs were measured using an MFL brand 100 kN controlled loading device. It should be noted that the samples are not full size due to mycelium growth and have rough surfaces. In addition, MBCs, which are ductile materials, did not disperse after flexural tests. For this reason, compressive strength tests were carried out by dividing the samples with a utility knife. Flexural strength measurement is based on BS EN 196-1 (2016). Three samples were used for each composite mixture, and calculations were made by taking the average of the results. The flexural strength was calculated using the formula 3.4.

$$R_f = \frac{1,5xF_fxl}{b^3} \quad (3.4)$$

R_f : is the flexural strength, in megapascals.

b : is the side of the square section of the prism, in millimetres.

F_f : is the load applied to the middle of the prism at fracture, in newtons.

l : is the distance between the supports, in millimetres.

Compressive strength measurement is based on BS EN 196-1 (2016). Measurements were made on three samples each and calculated using the formula 3.5.

$$R_c = \frac{F_c}{1600} \quad (3.5)$$

R_c : is the compressive strength, in megapascals.

F_c : is the maximum load at fracture, in newtons.

1600 : is the area of the platens or auxiliary plates (40 mm × 40 mm), in square millimetres.

3. FINDINGS and DISCUSSION

In this section, the results of the physical and mechanical property tests are presented, starting with the growth analysis of the samples produced in the studies, depending on the production parameters.

3.1. Investigation of Mycelium Growth

MBCs were produced by mixing 16 different substrates with *Pleurotus ostreatus* in order to observe the effect of substrates on the growth and properties of the composite formed. In the composites formed as a result of experiments 1,3, 5, 6, 8 and 9, molding occurred during the growth period and mycelium growth did not reach the level to completely cover the surface. In addition, scattering was observed in the samples of tests 1, 3, 5, 7, 8, 10, 12, 13, 14 and 16, due to little or no growth of the binding mycelium. In the composites formed as a result of tests 2, 4, 11 and 15, mycelium growth surrounded the surface and the materials were allowed to adhere to each other. No mold growth was observed during the 28 day growth period. The visuals of the composites formed as a result of the tests are given in Figure 2.

Figure 6. Mycelium growth in samples formed as a result of experiments.

3.2. Physical Property Tests Results

The volume calculation was made by taking into account the irregularity in the shapes of the samples due to mycelium growth. The volume, initial weight, dry weight, dry density and moisture content of the samples are given in Table 5. Dispersion was observed in the samples belonging to tests 3, 9, 10, 12, 13, 14 and 16 due to low and no mycelium growth. Therefore, relevant measurements could not be made. Since the water absorption rate will determine the material's durability over time, it is an important factor in determining the potential of MBCs in various uses, such as indoor applications and insulation material. High water absorption rates are expected as the composite components are organic products. The data on the water absorption rate of the test samples under atmospheric pressure are given in Table 5. When the

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

MBCs are compared, it is seen that test samples 4 and 6 have relatively less water absorption than the other samples.

Table 7: Physical property tests results.

14	Not measured.		
15	280,50	70,77	222,82
16	Not measured.		

3.3. Mechanical Property Tests Results

Since there is no standard test procedure for MBCs, the test was stopped when cracks began to appear in the specimen during the flexural strength measurement. In the compressive strength, the test was stopped when the compression value of 43% was reached based on the literature (Gauvin et al., 2022). Since adequate mycelium development was not observed in tests 1, 3, 5, 6, 7, 8, 9, 10, 12, 13, 14, and 16, the retention rates of the mixture components against each other are meager. Therefore, the samples were scattered, and mechanical tests could not be performed. The values in the measured samples are partially consistent with the growth observations in previous studies. Samples containing beech sawdust and pulp with dense white mycelium biomass showed higher strength than straw and textile waste samples. In the reference study, samples containing rapeseed straw showed a compressive strength of 0.452 MPa, and samples containing cellulose fiber showed a compressive strength of 0.145 MPa (Gauvin et al., 2022).

In addition, ductile fracture is observed in experiments 11 with textile waste and 15 with pulp. The findings obtained in our study are similar to the previous study. With the study in which different substrate were tested, it is seen that the substrate properties have a significant effect on the composite material. Data on mechanical property tests are shown in Table 6.

4. CONCLUSION and RECOMMENDATIONS

The preliminary research findings contribute to the field of biological materials as it provides an overview of the manufacturing processes of MBCs, particularly mechanical and physical experiments. This study investigates the possibilities of producing MBCs by combining *Pleurotus ostreatus* type mycelium with different types of lignocellulosic reinforcements pioneered by studies in the literature. The study's main purpose is to determine the appropriate environment and conditions for producing MBC under current laboratory conditions by conducting preliminary tests. In addition, this study is important in determining the mixing ratios to be used in forming MBCs and eliminating the lack of information from the information not shared in the current literature due to various concerns. When the growth periods of the test mixtures prepared with the mixing ratios of the two referenced studies were examined, it was seen that the growth was at the minimum level in the mixture with a mycelium + substrate ratio of 1:4. The expected yield was obtained from a 1:2 mixture of mycelium + substrate. In order to determine the effect of the substrate to be used on the composite, several preliminary physical and mechanical tests were carried out on the samples formed with 16 different substrates at the determined mixing ratios. Different growth rates were observed in the samples produced. One possible explanation for these results is that a growth difference occurs due to the difference in cellulose, hemicellulose, and lignin ratios in the feedstocks.

Although the mechanical properties still need to be optimal, this research shows that MBCs have the potential to replace petroleum based materials. However, the water absorption rate of

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

the composite consisting entirely of organic materials should be reduced for structural applications.

The methodology used to evaluate the suitability and selection of organic waste streams through preliminary studies has also proven effective for MBCs production applications. The study shows that the manufacturing process affects the desired properties of the composite. In addition, further research should be carried out in order to learn the potential of the composite to meet other relevant properties expected from insulation materials.

ABSTRACT

It is seen that the facade character of Traditional Konya Houses has changed depending on the plan type in the historical process. When we look at the first examples of traditional Konya houses, the importance given to functionality in the plan left ornamentation and aesthetics in the background; this situation was reflected on the facade as simplicity. Later, with the development of materials and construction techniques, the importance given to the facade increased; two different facade features, asymmetrical and symmetrical, began to be seen. The widespread use of houses with a space called "life" in Konya caused asymmetrical designs to be seen more frequently. Especially L-type house plans with inner sofas can be given as examples of asymmetrical houses. Symmetrical facades, on the other hand, have started to be preferred to emphasise the wealth, position or prestige of the owner of the house with the increasing importance given to exterior appearance as well as functionality. Facade designs were created by being influenced by various European architectural movements, especially Baroque and Neoclassical, and applications were made through craftsmen who learnt the techniques and motifs of these movements. In this study, facade elements of traditional Konya Houses are analysed under five headings: materials and techniques, door and window joinery, overhangs, roof and eaves, ornaments and motifs.

Keywords: Konya Houses, Architectural Facade, Traditional Ornaments and Motifs.

1. INTRODUCTION

People also change the place they live in with the knowledge they acquire over time and the technology they use. It is seen that Konya houses have also changed in the historical process. The breaking time of this change is the emergence of the idea of westernization at the end of the 19th century, transportation, communication systems and the change in economic conditions in Konya (Aygör, 2020).

When it comes to Konya House, different plan types come to mind. Traditional Konya Houses are built with mudbrick material, in the plan type with "hayat"(courtyard) or "mabeyn", with flat earthen roofs, in an order in which dead-end streets take place in social life. Around the houses; there are spaces that provide socialization with life, garden and outbuilding sections. Houses are generally built on a single storey. Dead-end streets created social spaces with neighbors. According to Islamic life, garden walls are high for hiding and protection, and ground floor street facades are left deaf. It is possible to see a design closed to the outside in most of the traditional Konya Houses. Houses consist of their own inner worlds (Dülgerler, 2014).

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium **September 14-15, 2023, Naples, Italy**

Various factors have been effective in the development and change of Konya Houses. Increasing population due to urbanisation, economy, change of labour force, migration movements, western architectural elements, technical developments in architecture have affected traditional houses. Stone and brick started to be used as building materials. The plan with interior sofas became widespread, gradually expanded and increased in size. Roofs were started to be used in the upper cover. Houses have two or three storeys. With the disappearance of gardens in Traditional Konya Houses, the transition from public space to private space has been achieved. Streets lost their importance in terms of social relations and remained as roads to reach the houses. When the idea of a multifunctional room disappeared, the use of a load and gusülhane in each room also disappeared (Özer, 1989). The kitchen and latrine in the garden were moved inside the house. With the connection of mains water to the houses, fountains, baths and hammams started to take place inside the houses. With all these changes and transformations, facade design, which is one of the most important elements, has also started to change. For this reason, the importance of traditional facade design has become even more important.

2. MATERIALS and METHODS

The aim of this study is to examine and evaluate the facade architecture of Traditional Konya Houses in the historical process and to present a general compilation study. In this context, literature reviews related to the subject were made, observations and on-site examinations were made and determinations were made about the facade architecture.

3. FINDINGS and DISCUSSION

It is seen that the facade character of Traditional Konya Houses has changed depending on the plan type in the historical process. When we look at the first examples of traditional Konya houses, the importance given to functionality in the plan left ornamentation and aesthetics in the background; this situation was reflected on the facade as simplicity. Later, with the development of materials and construction techniques, the importance given to the facade increased; two different facade features, asymmetrical and symmetrical, began to be seen. The widespread use of houses with living rooms in Konya caused asymmetrical designs to be seen more frequently. Especially L-type house plans with interior sofas can be given as examples of asymmetrical houses. Symmetrical facades, on the other hand, have started to be preferred mostly to emphasise the wealth, position or prestige of the owner of the house with the increasing importance given to external appearance as well as functionality. Facade designs were created by being influenced by various European architectural movements, especially Baroque and Neoclassical, and applications were made through masters who learnt the techniques and motifs of these movements (Aygör, 2020). In Figure 1, Arapoğlu Kosti House, one of the important architectural structures of Konya, which has a symmetrical design, is given. In this part of the study, the facade elements of Konya houses are examined under five headings: materials and techniques, door and window joinery, overhangs, roof and eaves, ornamentation and motifs.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Figure 1. Rock tombs (Dinc & Gül, 2022)

a. Material and Technique

Common materials in Konya Houses are stone, brick, adobe, wood, reed, reed, reed, kindıra, famerite, tile, various metals and concrete. In houses where the facade is left plain, the main building material has a direct effect on the character of the facade. In this respect, the choice of material is very important in terms of both the construction phase and the aesthetic value of the house. Stone material is used as the foundation material in almost all of the traditional Konya Houses and it is seen that it is extended to the flood level in many houses. Factors such as the type of stones, their sizes, corner stones, colours, and the way they are arranged are the factors affecting the character of the facade. Adobe is a building material applied with masonry technique which is frequently preferred in Konya. The suitability of the existing soil chemistry for use as a building material has been effective in this preference. Adobe and stone materials were widely used in Konya Houses not only in building construction but also in the construction of elements such as all auxiliary units and garden walls next to the house (Aygör, 2015).

Although brick is a material commonly used in the construction of partition walls today, it is a material preferred in the construction of hedgehog eaves in Traditional Konya Houses. Hedgehog eaves is a technique created by different arrangement of brick corners and gives movement to the facade. Wood has always existed in Turkish culture and has always been an important building material of the Traditional Turkish House. The use of wooden materials is widespread from basic carrier elements such as wooden struts, wooden beams and struts to interior fittings (Karpuz, 2001). Reed, thatch and kindıra are traditional materials used in Konya houses. They are mostly used in floor coverings, ceilings, roof covers and garden walls. Famerit, i.e. Italian tile, is a type of material mostly used in flooring. It is frequently seen in public buildings (Sözen & Tanyeli, 1996).

Roof tiles appear in two different forms. These are Alaturka and Marseille type tiles. Alaturka type tiles are the first application seen after the earth roof applied as roof cover in Konya (Hasol, 1998). However, due to the high weight of this type of tile, it was replaced by Marseille type tile after a while. Marseille type tile is a machine produced product. In the 19th century, the products imported from Marseille started to be produced in Turkey. In Ragıp Anadolu House, one of the important houses of Konya, there are Marseille type tiles (Figure 2).

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Various metal applications are mostly seen in railings and stair railings.

Figure 1. Marseille type tile on the east facade and roof of Notary Ragıp Anadol Residence (Aygör, 2015)

When the construction techniques in Traditional Konya Houses are analysed, it is possible to see masonry (masonry), hımış and bağdadi techniques. The most commonly observed masonry technique is the type of construction in which mostly stone and mudbrick materials are placed on top of each other and connected with beams (Hasol, 1998). Hımış, on the other hand, is a construction technique obtained by filling the wooden frame with mudbrick, stone or brick. While a single material can be selected as filling material in a dwelling, in some dwellings more than one material is used for filling purposes (Sözen & Tanyeli, 1996). Bağdadi construction technique is the construction technique in which the slats between the wooden uprights are filled with mudbrick and then plaster is applied on top. In Konya Houses, it is mostly applied on projections and attics (Sözen & Eruzun, 1992). Bağdadi technique is also used for ornamentation purposes with jamb and lintel appearances on the facades (Günay, 2007).

b. Doors and Windows

In Konya Houses, the entrance doors to the house are mostly wooden. Over time, with the processing of various metals and the ease of manufacturing, metal doors with security-enhancing qualities have started to be seen. The construction technique of wooden doors is of two types: nailed and trayed. The nailed doors form a part of the general facade design in traditional houses and show integrity with the facade. Tabled doors are mostly doors that have been changed later. It is possible to categorise the doors on the facade in three groups as "garden doors", "external entrance doors" and "entrance doors with table".

Garden doors are located on the garden wall in Traditional Konya Houses. They are mostly double winged and in hammered technique. The carvings and binding nails on the door repeat in a certain order and it is aimed to obtain an aesthetic appearance. The external entrance doors are mostly single winged and were used for entrances to auxiliary units next to the dwelling such as barns. Exterior entrance doors with tray are generally symmetrical doors produced in a wide variety of designs.

When the window joinery of Konya Houses are analysed, it is seen that wooden joinery is widely used. Aygör (2015) divided the windows into three groups according to their opening types: guillotine, fixed at the top, two-winged at the bottom and two-winged windows opened at the top and bottom. The facade where the window is located directly affects the design of the window, whether it is opened or not, and the opening direction.

c. Overhangs

It is seen that the overhangs were constructed with bagdadi or himiş technique in Konya Houses. Due to the construction technique, the wall thicknesses in the projections have a width of 20-30cm. The overhangs are mostly located in the living room. Therefore, the width of the overhang is determined by the dimensions of the room. The fact that the place where the protrusion is located in the hall is turned into a sitting place by raising it with wooden supports is a formation frequently seen in Konya Houses. This area is furnished with ottomans and it is aimed to create a bright sitting environment with large windows. The windows here are mostly guillotine type.

Figure 3. Types of overhangs (Aygör, 2015)

When the upper cover of the overhangs is analysed, it is seen that either a design directly attached to the main roof or a roof cover design specific to the overhang was created. In the lower part of the overhangs, it is seen that there are buttresses (eliböğründe), which have both a carrier and aesthetic appearance and are mostly made of wood. Aygör (2015) analysed the projection types in 5 groups as "one-way, two or three-facade projections", "miter room projections", "facade projections", "three-cornered projections", "five-cornered projections". The specified projection types are given in Figure 3.

Another type of formation seen on the facades of Konya Houses are jihannumas and balconies. Cihannumas are located on the roof floor. It is independent from the general roof cover and has its own top cover. It is a kind of observation terrace (Hasol, 1998). In this respect, it gives movement to the facade. Balconies appear in two forms in Konya Houses. The first one is the balconies built as an extension of the building in the form of a projection. These balconies are either open or have their own roofs. The second is the type of balcony created by leaving a space between the rooms and pulling this space inside. In this type of balconies, the roof cover of the house also covers the balcony (Aygör, 2015).

d. Roof and Eaves

Two types of roofs are commonly seen in Konya Houses.

- Flat Roofs with Earthen Roof
- Alaturka Tile Covered Sloping Wooden Roofs

Flat Roofs with Earthen Roofs: It is positioned on thick wooden beams with round cross-section. Beam spacing is kept short to ensure strength. 30-40 cm clay soil is laid on the bearing beams and compacted. Since the clay soil varies depending on the weather conditions, in rainy weather, a hand roller called "loğ stone" is used on the roof for compaction. This process is important in terms of waterproofing (Turkosfer, 2023).

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Alaturka Tile Covered Sloping Wooden Roofs: This type of roofs are frequently encountered in traditional Turkish houses. The roof construction is of wooden sitting roof type and it allows large openings to be passed compared to flat roofs with earth roofs. In timber frame buildings, the roof is placed on the carrier frame. Due to the slope, the gable roof gable ends on the rear or side facades are used as exhibits for storing vegetables and fruits. Alaturka tile used as roof covering is a corrugated roof covering material made of terracotta (Aygör, 2020).

Eaves, which are one of the characteristic features of Traditional Turkish Houses, are one of the important elements in facade architecture. The eaves, which are a part of the upper cover that can be felt and observed from the ground level, have a direct effect on the mobility of the facade.

Another effective element on the facade is the bay windows. In the Turkish house, with the help of bay windows and eaves, the rooms were enlarged, a good lighting and ventilation solution, orientation to the view, and protection of the entrance door from rain were obtained. While achieving these solutions, principles such as aesthetics, proportion and most importantly being on a human scale have always been observed. In the facade design of the Turkish house, eaves and bay windows provide harmony and harmony between fullness and emptiness. When we bring together elements such as the $\frac{1}{2}$ ratio in doors and windows, the shaping of the bay windows in relation to the living room, and floor heights, all the characteristic features of the Turkish House appear in harmony with the environment and people in a unity (Figure 4) (Günay, 1998).

Figure 4. Various eaves types (Günay, 1998)

e. Ornament and Motifs

In traditional Konya Houses, it is seen that ornamental elements are concentrated in the interior rather than the exterior. In Konya Houses, which have developed and changed over time, it can

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

be said that the ornamental motifs on the exterior facade have increased. For this reason, the ornamental qualities of Konya Houses will be explained under two headings: exterior ornamentation and interior ornamentation.

- Exterior Decorations

Exterior ornamentation is not frequently seen in Traditional Konya Houses. The houses are designed quite simple in terms of their facade appearance. The simplicity of the material is the most important element of the facade. However, it is possible to talk about spiked eaves and different arrangements of building materials that will give mobility to the facade (Erpi, 1987).

Stone: In Konya, it is possible to see stone materials in ornamentation. Sille and Gödene stones are frequently used. It is also common to use it together with different materials. In the combination of different materials, stone is used up to the level of the water basement and then it is possible to switch to different materials. The use of stone material is also frequently seen in the corner stone application, which has a static quality. Corner stones also give a characteristic quality to the facade. Corner stone applications can be seen in two forms as surprised and straight. In the staggered arrangement, rectangular and square pieces are arranged one on top of the other in an orderly manner in the vertical direction. In the straight arrangement, rectangular or square pieces are raised vertically on a single surface (Aygör, 2015).

Wood: Wood also has an important place in exterior ornamentation. Wooden ornaments are found on entrance doors, windows, eaves and overhangs. In traditional Konya Houses, it is known that the ornamentation on the exterior doors is made with large cabara nails on nailed doors. This type of examples are also encountered in old Konya photographs (Aygör, 2015).

- Interior Decorations:

It is possible to see similarities between the motifs and decorations seen in the interior of the Turkish House and the facade decorations. In this respect, interior decorations were also examined under a title within the study, but since the subject of the study is within the scope of exterior facade features, only a brief information about interior decorations was given.

In interior ornamentation, Konya Houses do not make a complete distinction with the traditional Turkish House. In the developing and changing houses, except for the houses with furnished equipment, the interior equipment is generally similar to the traditional Turkish House. However, gradually over time, the same interior equipment in every room has started to disappear.

"S" and "C" curves, which are mostly seen on the interior fittings and have baroque inspirations, are also encountered on the exterior facade (Aygör, 2015).

4. CONCLUSION and RECOMMENDATIONS

It has been determined that Konya houses exhibited two types of construction in the early 19th century and the first half of the 20th century, with a traditional style and European architectural influences. It is seen that the facade design of a traditional Konya House is quite simple. The entrances to the garden or side facades are not remarkable. These entrances lead directly to the courtyard. The main entrances of the houses have flat rectangular wooden frames and are at the same level with the ground. The roofs are generally flat earth roofs with traditional features, and in some examples, gable roofs were added later.

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

All these findings show the existence of a rich house architecture in Konya. As a result of the investigations, it has been observed that historical houses in Konya are experiencing a rapid process of extinction. There are many street sanitation and restoration practices carried out by the public in the name of protection. However, it is seen that these applications are insufficient. Konya should protect the historical Konya Houses by providing the contribution of the public and private sector in a way to satisfy its own people.

ABSTRACT

Highway noise, which emerges as one of the most important environmental noise sources in cities, affects educational areas, settlements, recreational areas, etc. It negatively affects the use of many urban areas and human life. In this context, noise planning studies are carried out and various methods are applied to reduce/prevent highway-borne environmental noise. Noise barriers are one of the methods created to reduce the negative effects of environmental noise. In the study, bibliometric analysis of research on noise barriers and their designs within the scope of highway noise planning is presented. With the analysis, using the keyword "highway noise barrier and design", the areas in which the studies in this field are concentrated, the subjects of study, the aging rate of the subject, the development process in time, the distribution according to countries and authors, the most influential authors and journals on the subject were revealed. Studies in peer-reviewed journals between 1980 and 2020 were scanned in the WOS database (325 scientific studies) and analyzed through the R program. Analyzes are presented with various network and clustering graphs. In the study, which provides an overview of noise barriers and design, it is seen that the publications listed chronologically have increased significantly since 2010 and that studies on air pollution, pressure and noise barriers have increased in recent years. This study aims to reveal the main trends and gaps in the literature regarding highway noise planning and noise barriers.

Keywords: Noise Planning, Highway Noise Barrier, Bibliometric Analysis, Barrier Design.

1. INTRODUCTION

In recent years, the increase in environmental pollution caused by natural and human factors has increased concerns about environmental problems and environmental protection (Pandya, 2001). In addition to the negative effects on the environment, environmental pollution affects urban users physically and psychologically (Liu et al., 2021). Solutions are sought and developed by local governments and planners for noise pollution, which is primarily one of the environmental problems (Barrigón et al., 2010). The concept of noise was first discussed as a pollutant at the World Environment Congress in Stockholm in 1.972 (Buss, 2007).

Highway noise is seen as the most important noise source in cities. Highway noise is related to many factors related to the city and the morphology of the city, and the physical condition of the highway, the condition of the vehicles and the speed of the vehicles are effective on the

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium **September 14-15, 2023, Naples, Italy**

noise level (Crocker, 2007; Abhishek et al., 2012). In urban residential areas, highway noise is mainly dependent on highway-generated noise and noise parameters reflected from building surfaces (Apparicio et al., 2018; Szopińska et al., 2022).

Noise action planning should be included in urban planning against noise pollution that negatively affects human health and quality of life (Brown & Van-Kamp, 2017; Singh et al., 2018). The main purpose of noise planning is to realize plans to reduce or prevent noise. There are various methods for noise control to minimize the urban noise impact from highways (Burge, 2019; Choi et al., 2022). The main methods included in noise action plans are speed reduction measures, use of appropriate materials on road surfaces, traffic management and noise barriers (Hintzche & Heinrichs, 2018). Noise barriers, which have emerged as one of the most effective methods to prevent traffic noise, reduce most of the noise with various designs and materials (wood, polycarbonate, glass, metal, etc.) (Pinsonnault-Skvarenina et al., 2022; Michaud et al., 2008). Noise barriers can be divided into 2 classes: structural and vegetative. In addition, these barriers are classified as long and short barriers (Lodico, 2023).

There are many examples of studies and applications within the scope of noise barriers to reduce highway traffic noise and noise in the world (Bouzid et al., 2020; et al., 2021; Yıldırım & Arefi, 2021). In order to reduce the impact of noise on human health in cities, noise planning and noise barriers should be given the necessary importance.

Bibliometric analysis research, which forms the basis of this study and enables statistical analysis of studies in a field, has been increasing significantly in recent years (Özel & Kozak 2012). New software programs enable the processing and categorization of data from academic databases. In addition, it analyzes keywords, authors, countries, journals, etc. on the subject of the study and reveals their relationship with each other (Khan et al., 2022).

In this study, which aims to provide an overview of the studies on noise barriers and designs within the scope of noise planning, a bibliometric analysis was conducted on the subject. With this study, it was tried to determine the rate of development of the subject, which topics it has evolved towards, which methods are used, country, author, journal relations and deficiencies in this field of study.

2. MATERIALS and METHODS

Articles on noise barrier and design scanned in Web of Science were used as the main material in the study. By searching the WOS database with the keyword "Highway noise barrier and design", 325 articles between 1980 and 2022, including articles, book chapters, papers and reviews, were included in the study. Bibliometric analysis was performed using R Studio software to analyze and evaluate the data obtained in the study. The analysis was conducted through the "bibliometrix" package developed by Aria and Cuccurullo (2017). Within the scope of the analysis, general information about the data, annual scientific production, relationship network of keywords, word cloud, trend topics, word growth, three fields plot, the most relevant authors, most relevant sources and the countries with the most studies were identified. All these analyses are expressed with network and clustering techniques and graphical representations.

3. FINDINGS and DISCUSSION

The studies on Highway Noise Barriers and Design are based on the years 1980-2022 as the time period. In this context, there are a total of 325 scientific studies on the subject in the WOS database and 203 of these studies consist of articles (Table 1).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Table 1. Main information

Highway noise barrier and design	Description	
	Data Collection	
	Time Span	1980:2022
	Sources (Journals, Books etc.)	156
	Documents	325
	Document Types

	Book Chapter	3
	Proceedings, Reviews et al.	119

Academic studies on highway noise barrier and design have entered a rapid development process since 2006, and a decrease in studies on this subject was observed in 2019 (Figure 1).

Figure 1. Annual scientific production

Within the scope of bibliometric analysis, different clusters come to the fore in the relationship network map consisting of keywords (Figure 2). In the map with 5 different main clusters, the frequency of words is related to the circle sizes of the clusters. In the study, the main cluster labels are sound, noise barriers, dispersion, model, road traffic, acoustic performance, exposure. The proximity of similarly colored concepts to each other indicates their frequency of use together, and in this context, the words used in relation to the orange group can be grouped as pressure, traffic noise model, air pollution, environmental noise, and in the green group as road traffic noise, health, prediction, disturbance, behavior (Figure 2).

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

Figure 2, which shows the trend topics of the most used words in the temporal process, is based on the years 1996-2000. In this context, it is seen that the sub-topics on the subject have increased since 2010. In recent years, studies on air pollution, pressure, city, noise and noise barriers have increased (Figure 4).

Figure 4. Trend topics

When the development process of words is analyzed, it is seen that the words performance, exposure and traffic noise have gained the most momentum. While the words annoyance and sound came to the fore in the beginning, it is concluded that the topics diversified over time, but words such as pollution remained constant between 1999 and 2007 (Figure 5).

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

Figure 5. Word growth

In the three fields plot showing the relationship between authors, keywords and sources, journals are on the left, keywords in the middle and journals on the right. The analysis of the 20 most influential data shows that journals such as Applied Acoustics, Atmospheric Environment and Sustainability are leading the way in this field. It was revealed that most of the most relevant authors (Monazzam MR, Botteldooren D, Van Renterghem T) frequently used the words "model, performance". Although studies on air pollution have increased in recent years, it is understood that it has fewer studies, ranking lower in the analysis (Figure 6).

 September 14-15, 2023, Naples, Italy

Figure 6. Three fields plot

When the country-specific distribution of scientific publications on the subject of the study is examined, it is seen that the United States, Iran, Canada and China are in the first place, while Turkey ranks 25th in scientific production within the subject. The most relevant sources on the subject are given in Figure 1. In this context, the journals with the highest number of publications are "Applied Acoustics, Atmospheric Environment, Journal of The Acoustical Society of America" (Figure 7).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 7. Most relevant sources

Figure 5 lists the most relevant authors in the field of noise barrier and design. Monazzam MR, Fard SMB and Baldauf R are the leading contributors (Figure 8).

Figure 8. Most relevant authors

4. CONCLUSION and RECOMMENDATIONS

In this study, academic studies on noise barriers within the scope of noise planning were examined from the past to the present and it was aimed to provide a basis for future studies. In this context, 325 articles related to the subject were systematically reviewed, categorized and analyzed. Noise pollution, which has come to the agenda with environmental problems in

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

recent years, has become an important area where measures should be taken by increasing in the temporal process. Noise barriers and their design, which have seen a significant growth in the literature since 2006, have been examined by many authors and divided into different subheadings. These diversified sub-topics include topics that aim to provide solutions to today's environmental challenges. In this context, conceptual analyses have focused on research topics such as performance, pressure, dispersion, barriers and wind tunnels, and these studies are frequently used. When the most cited studies, which form the focus of noise barrier and design, are evaluated, it is seen that acoustic performance, air pollution, traffic noise model concepts are additionally studied.

This study provides an important resource for noise planning and noise barriers and is limited to the WOS database. In future studies, increasing the scope of the subject and conducting analyzes with other databases will contribute to the subject of the study.

Thanks and Information Note

This study was supported by Atatürk University Scientific Research Coordination Unit within the scope of doctoral thesis project with project number FDK-2023-11588.

ABSTRACT

Worries about making the earth uninhabitable in the future due to the irresponsible activities of humans have triggered man's ambition for discovering and making new homes in outer space. Aligned with the competition held in Turkey for Space Research in 2022, this paper discusses designs and projects that respond to different living conditions in space. Moreover, this paper examined the idea that offers solutions for producing and utilizing materials and forms in the design according to living conditions in the space. The proposed design aims to produce the initial living spaces with the help of 3D printer robots that utilize the regolith on the Moon's surface for construction. The prototype of the proposed design was produced using 3D printing technology, with PLA as the building material. NASA's 3D printing technology, which was established for extraterrestrial research, was also examined. It has been determined that the proposed design for the Turkey Moon Bases competition is compatible with NASA's 3D printing technologies. The research concludes that the use of such tools is effective in creating a habitat on the Moon and in producing other alternative living spaces on other planets.

Keywords: Moon, Space Researches, 3D Printing.

1. INTRODUCTION

For thousands of years, Earth has been the only known planet where vital activities can be carried out. However, with the rapid depletion of resources on Earth and the exponential population growth, the search for alternative resources and living spaces has come to the forefront. As a result, the search for life and resources beyond Earth has recently attracted considerable interest. As part of this effort, many countries are investing heavily in space exploration. Some of the institutions involved in space research include the United States National Aeronautics and Space Administration (NASA), the Russian Federal Space Agency (Roscosmos), the China National Space Administration (CNSA), and the European Space Agency (ESA). In our country as well, recent efforts have been made in the field of space research. In this context, the Turkish Space Agency (TUA) was established in Turkey in 2018. The Moon, Earth's satellite, plays an important role in space research. It serves as a station for reaching the depths of space, and it is planned to travel to the depths of space from the Moon (Erdem, 2012). In addition, solutions can be developed to obtain the necessary energy from lunar resources.

One of the biggest challenges in creating extraterrestrial habitats is the lack of sufficient human labor. In this regard, different solutions are being explored for the production of living spaces

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

for humans. In recent years, advanced 3D printing technology is one of these solutions. With 3D printing technology, building constructions are successfully realized today (Özeren et al., 2023). The use of 3D printing technologies with autonomous methods, which do not require human labor, is important for enabling construction and establishment on different planets. This allows for the initial stage of constructing and establishing on a new planet. Moreover, it is crucial to consider activities like consuming food and drinks, as well as socializing, which are necessary for human physical and psychological adjustment to a foreign environment.

In 2022, the Bursa Metropolitan Municipality, Bursa Technical University, Bursa Provincial Directorate of National Education, and the Gokmen Space and Aviation Training Center (GUHEM) organized the Turkey Lunar Bases National Idea Project competition. The competition aimed to generate visionary solutions for the search for life beyond Earth. Our project, designed for this competition, was awarded the Jury Incentive Award in the professional category. This work will focus on the use of 3D printing technology for lunar bases and living spaces based on the project we presented. Thus, the aim of this study is to serve as a guide for Turkey's space research.

2. MATERIALS and METHODS

This project work forms the core material for the Turkey Lunar Bases National Idea Project competition held in 2022. Additionally, it will draw from existing studies related to the Moon. In this context, during the design of the lunar base, several issues were identified and addressed under the headings of settlement, lunar features, form, shell, resource search, production, and psychological factors. The study will provide project details proposed for Turkey Lunar Bases under these headings.

3. Lunar Base Design

In the present day, changes occurring in various sectors, technological advancements, and innovations are of significant importance for the scientific community in our country. These developments, when made available and applicable, with their expanding areas of use, can contribute not only to the national economy but also to employment. Especially in the field of architecture, which constantly reinvents itself in tandem with technology, 3D printers hold a crucial place. 3D printers have become an integral part of the technological world, utilizing various materials. Although we may not directly witness these developments in our industrial sector and university laboratories, they continue to progress globally through scientific research and applications. This development encompasses material, technology, and dimension, enabling printers to acquire new functionalities.

Living and working on the Moon, due to the absence of atmosphere, primarily relies on the protection of lunar inhabitants from radiation and the maintenance of a breathable atmosphere pressure, either through spacesuits or within a natural environment (Cohen, 2002). Several challenges and risks are associated with this:

- Lack of natural light.
- Atmospheric preservation.
- Maintenance and loss of internal pressure.
- Increased personal safety risk while moving between modules (space suits and vehicles).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

- Space constraints limiting food growth, terraforming, physical exercise, mental health, and connection with nature.
- Inability to study the full physical capabilities of the human body in microgravity.
- Micrometeoroid impacts jeopardizing all habitats.
- Internal explosions.
- Radiation.
- Dust invasion in habitats.
- Thermal elastic loading.

Considering these factors, various architectural design research studies have been conducted for long-term lunar residents (van Linden Tol et al., 2022).

a. Concept

Inspiration has been drawn from the life cycle of a cocoon transforming into a butterfly for the design of a living base on the lunar surface (Figure 1). The cocoon is the chrysalis stage of an insect group that undergoes complete metamorphosis. Once their growth is complete, the caterpillar, during the transition to the adult form, creates a protective layer from a silk thread, and their body development is completed within this layer. In the design, the aim was to initially target the formation of a suitable protective layer based on the morphology of cocoon formation for unmanned vehicles sent remotely according to lunar conditions. With the completion of the cocoon, the structural base is finished and becomes suitable for human habitation, allowing the critical protective shield to be completed unmanned. Subsequently, it allows for the transformation into desired forms to meet different needs. This way, a self-sufficient and comprehensive production base is completed. Initially aimed at units for 20 individuals, over time, it enables the establishment of colonies of various sizes. The central base in the main settlement serves as a research and production center, specialized for vertical hydroponics, made of basalt glass. Interconnecting elements link different units, allowing for the abandonment of one unit and the integration of new units into the system in case of adverse conditions.

Figure 1. Cocoon concept diagram

b. Settlement on the Moon

The southern polar region of the Moon has been chosen as the settlement site with the aim of producing water from surface ice and obtaining uninterrupted energy from continuous sunlight (Figure 2). In this region, it is planned to leverage natural coverings such as natural cliffs or

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

caves for an ideal settlement. Following the assurance of sufficient resources and energy supply for the establishment of a living center on the lunar surface, developments are aimed at establishing multi-center bases in the craters of Biruni, Ibn Sina, Tusi, Ulugh Bey, Ali Kuşçu, Fatih Sultan Mehmet, and Atatürk, to further these goals.

Figure 2. Settlement on the Moon

c. Local Features

The lunar surface is covered with an irregular layer of various rock fragments, which are suitable as construction materials (Horz and Cintala, 1996; Wang et al., 2022) (Figure 3). Therefore, the utilization of lunar soil presents the most economical and feasible option for on-site development and construction of lunar bases (Bennett et al., 2020).

Figure 3. Geological structure of the Moon (Hörz et al., 1991)

The physical properties of lunar soil, also known as regolith, are anticipated to form the foundation of future production on the Moon and in space. The geometric and mechanical characteristics of lunar soil significantly differ from Earth's soil due to substantial environmental disparities between the two locations (Tang et al., 2020). Numerous studies have been conducted to enhance the preparation of simulated soil and apply it to lunar/Martian

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

structures, aiming to increase its resemblance to actual lunar soil (Battler and Spray, 2009; Carpenter et al., 2006; Hörz and Cintala, 1997; Pitcher et al., 2016; Sibille et al., 2006; L. A. Taylor et al., 2016; Toklu and Akpınar, 2022; Zarzycki and Katzer, 2019).

According to Lin et al.'s report (Lin et al., 2022), lunar regolith is estimated to contain around 120 parts per million (ppm) of water (OH + H₂O), primarily attributed to solar wind implantation. Oxygen is also present in lunar soil, known as regolith. Oxygen can be liberated from metal oxides through various chemical processes, enabling the production of water or obtaining metal by-products. Regolith, which is envisioned for use as a construction material along with its diverse metallic components, forms the foundational building component of the lunar base to ensure sustainability and energy provision.

The utilization of lunar regolith on the lunar surface, facilitated by 3D printing robots, is aimed at producing the initial living habitats (cocoon). In this field, NASA has been known to conduct research encompassing technological advancements related to 3D printing of electronics, metals, outer-space structures, and additive repair technology (Bechthold et al., 2015). Therefore, it can be stated that the use of such tools is effective in achieving the planned objectives. At this stage, the structural potential of the coarse, fine dust known as regolith covering the lunar surface has been elucidated through studies by the European Space Agency (ESA) (Wittal et al.). Furthermore, the composition of lunar soil from various elements permits the production and use of various building materials (Franke, 2022).

d. Form

The structural formation of the cocoon draws inspiration from the architectural concept known as the 'Turkish Triangle,' a term that has made its way into architectural literature (Figure 4). Formally, the interplay of triangles in both solid and void configurations constitutes an effective shape in safeguarding against adverse lunar conditions, particularly meteorite impacts and radiation effects. Furthermore, for structures to be constructed on the lunar surface, spherical and cylindrical forms have been selected. The lunar gravity is six times weaker than Earth's, necessitating the preference for a spherical shape to adapt to this condition. Additionally, this choice ensures even distribution of potential pressures on the surfaces. The construction of these structures is planned to be carried out autonomously using 3D printers.

Figure 4. Lunar base formal formation

A prototype of the living module, designed with reference to the Turkish triangle shape, has been produced using a 3D laser printer. This process has demonstrated the feasibility of constructing the building under lunar conditions. The prototype in question was manufactured from filaments (Figure 5).

Figure 5. Prototype produced with a 3D printer

e. Structure and Cover

The philosophy of the caterpillar's life cycle has been sought to be applied throughout all stages of the construction of the lunar base. In this context, the silk protein found in the structure of the cocoon will be utilized in the shells of buildings. Silk protein possesses protective properties against UV radiation and water-binding characteristics. A novel material, with enhanced silk protein derived from the cocoon, lunar regolith, and polymers, will be developed to protect against meteorite impacts and radiation. Additionally, sustainable material cycling will be facilitated through silk production from silkworms in the production area on the lunar surface, with the aim of creating a natural habitat on the Moon.

The proposed lunar housing structure is planned to consist of three layers. The first layer is a dome that regulates indoor air quality and pressure. The second layer is a wall, made of regolith and reinforced silk, designed to withstand radiation and 3D printing. The third layer forms a surface with a Turkish triangle motif, referred to as the "pupa" (Figure 6).

Figure 6. Habitat formation layers

f. Search for Source

Photovoltaic panel arrays, along with solar concentrators that provide heat for processes such as 3D printing, can generate electricity. Solar panels can supply energy from sunlit areas to

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

shaded regions. Solar-powered electrolyzers can split water into oxygen and hydrogen, which can be used as a propellant or recombined in fuel cells for energy during nighttime.

Figure 7. Moon base production center and mobile devices used for resource quest

Exploration robots and astronauts can collaboratively investigate the lunar surface, including researching the geological composition of the Moon for gaining insights into space conditions (Figure 7).

Mining robots are aimed at supplying resources for converting processable lunar materials into an energy source. Leveraging the capabilities of mining robots is also a goal in obtaining water from polar regions and extracting oxygen from regolith.

Unmanned aerial vehicles can be employed for observations on the lunar surface and the depths of space. These vehicles also possess hydrogen-capturing capillary shells, enabling them to store hydrogen molecules. In this context, the use of autonomous technologies is of paramount importance.

g. Production

Diverse food sources with different characteristics can be cultivated using aquaponic and hydroponic systems to ensure the sustainable use of water resources. For this purpose, vertical farming areas have been designed at the central base. An enclosed greenhouse environment, illuminated with basalt glass and LEDs, is intended to be established. Additionally, plants recycle waste and convert carbon dioxide into oxygen, making them a vital component of the life support system. Furthermore, silk production from cocoon farming will be undertaken at the production center to generate silk protein. It is also contemplated to leverage 3D printing technology in the construction phase of this facility (Figure 8).

Figure 8. Lunar base production center graphic

h. Psychological Factors

Ensuring human adaptation to lunar conditions, both physically and psychosocially, is a fundamental criterion in the design of spaces to be established on the lunar surface. In this context, great care has been taken in the creation of spacious and open environments. Living spaces are designed with the intention of fostering a communal living culture by nourishing them with shared areas. This approach aims to facilitate social interaction among individuals and promote psychological well-being (Figure 9).

Figure 9. Layout and plans of cocoon structures

4. FINDINGS and DISCUSSION

In conjunction with the proposed designs for the lunar base, it has been recognized that construction using local materials from the lunar surface's resources can commence. In this context, 3D printers are expected to play a significant role in lunar operations where human resources are limited. With autonomous methods and the utilization of lunar regolith as a building material, it is evident that lunar-compatible structures can be established.

3D printing technologies have been found to play a critical role in the projects submitted for the Turkey Lunar Bases competition, as well as in internationally designed projects, for creating habitats on the Moon. Furthermore, considering international designs, it is believed that the proposed project for the Turkey Lunar Bases aligns with space conditions for achieving adaptability.

5. CONCLUSION and RECOMMENDATIONS

The Moon is at an important point in the search for life on different extraterrestrial planets. The Moon is used as a base to reach other planets. The Moon offers significant advantages in terms of lower gravitational force compared to Earth for interplanetary transportation. Moreover, beyond its utility as a base, it is evident that living habitats can also be established on the lunar surface. It has been concluded that 3D printing technology is one of the most crucial elements for production and establishment on different celestial bodies. Autonomous methods can leverage 3D printing technologies in the initial phase of construction necessary for sustaining life on various planets.

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

Simultaneously, concepts have been generated to facilitate the adaptation of humans to extraterrestrial living environments both physically and psychologically. The role of 3D printing technologies in the production and construction phases of these concepts is substantial. It is believed that the projects proposed for the Turkey Lunar Base Idea Project Competition could serve as guiding steps for our country in the field of space exploration.

ABSTRACT

Human-space interaction is a cognitive process that exhibits various interactions depending on behavioral situations. In this sense, the theory of place attachment describes how memories, emotions, ideas, and personal preferences influence a person's sense of belonging to a place. In this context, the aim of the study is to examine the important role that religion can have in the context of place attachment from a different perspective through a movie. The findings of the literature review indicate that the majority of research in the domains of architecture and interior architecture mostly concentrates on secular spaces, with a lack of studies examining religious spaces. Contrary to the limited research in the literature, the relationship between religious places and place attachment is illuminated by many indicators depicted in films. From a different viewpoint, the film analysis approach has been used to investigate the impact of religion on place attachment, as it is believed that the research has the potential to make valuable contributions to the existing literature. In the study, the movie "Baraka", which was produced in 2017, was considered. Through the events and dialogues in this film, in which different natural and physical environments are handled, the concept of place attachment has been analyzed comparatively with the existing literature, and its relationship with religion has been revealed. Based on a comparative analysis conducted with the existing literature, it has been observed that an individual's place attachment is influenced not only by the inherent characteristics of the place itself but also by various factors such as prayers, rituals, stories, symbols, personal experiences, and beliefs associated with the place.

Keywords: Place Attachment, Religion, Sacred Places, Architecture, Movie Analysis.

1. INTRODUCTION

Human-space interaction is a cognitive process that exhibits various interactions depending on behavioral situations. In this sense, the theory of place attachment describes how memories, emotions, ideas, and personal preferences influence a person's sense of belonging to a place.

In recent years, there has been a growing interest in the study of people's attachment to places (Mazumdar & Mazumdar, 1993). In this context, the study aims to examine the important role that religion can have in the context of place attachment from a different perspective through a movie.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

When the literature on place attachment is examined, it is seen that most of the studies focus on secular spaces and environments; the role of religion, sacred space, and place attachment studies is largely ignored (Mazumdar & Mazumdar, 2004). It is thought that religious places, places of belief, and sacred places should also be included in the literature on place attachment.

Place attachment can be associated with a sense of security, protection, and familiarity based on a sense of belonging and well-being (Fullilove, 1996) and feelings towards a place that often develop around past experiences (Bowlby, 1973).

Sense of place is derived from the use of all human senses, such as sight, hearing, touch, and smell (Lynch, 1962); it also refers to place attachment, human attachment, and love of place because topophilia is the emotional bond between people and place or environment and is pervasive in concept and vivid and concrete in personal experience (Tuan, 1974). Some places are more important than others because of their physical characteristics and the types of activities that take place there (Ruback, Pandey, & Kohli, 2008). Place can be intimately known, loved, and internalized in personal, religious, and cultural narratives, even if one has never physically been in a particular place that is longed for or imagined (O'Donnell, 2017).

W. Robertson Smith, in his 1907 work *The Religion of the Semites*, refers to the analogy between the lives of the first inhabitants of these lands and the lives of their gods:

"...the nomadic shepherd or the wild hunter has no fixed home and cannot imagine that his god has a home either, but he has a territory or area where his wanderings are usually limited, and within that territory he has his favorite dens or campsites. And on the basis of this analogy, he chooses for himself the sacred lands frequented by the gods, and the special spots within these lands where the god is particularly moved. In time, under the influence of the god and settled life, the sacred land becomes the property of the god and the special sacred spots within it become his temples (Smith, 1907)."

People perceive places differently because places have different material, social, and symbolic aspects; individuals have different backgrounds, experiences, and reasons for being in places (Ruback, Pandey, & Kohli, 2008). Mazumdar & Mazumdar (2004) argue that religion can have a profound impact on people's relationship with space through the architectural design of cities, neighborhoods, houses, and sacred buildings. They even argue that religion makes some places sacred by attributing symbolic meanings to them and that sacred buildings also strengthen social bonds.

Religions, constructed as cultural traditions by people for people, need spaces just as the human body needs a space. Holy places are therefore very human things. Places can become sacred not only because of religious texts or religiously significant events but also because of the intensity of human longing, prayers, and even battles fought for them. Each part of the experience of a sacred space increases its significance for the communities that recognize it as sacred. Sacred sites are therefore expressions of the hopes and fears of communities that aspire to be rooted in history, a community, and a territory (O'Donnell, 2017). Sacred places in religion are places of prayer, veneration, meditation, and education. Through their design, décor, and aesthetic value, these sacred spaces help to bring people closer to religious ideals, spirituality, society, and place. Ranging from elaborate and ornate structures to simple roadside shrines, remote cemeteries, and quiet monasteries, these spaces celebrate the sacred, inspire awe, and

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

inspire respect. The emotions experienced and expressed are largely influenced by the characteristics of the place, which helps to bind the believer both to the place and to the religion itself. For this reason, place is an integral component of many religions, and religions can play a major role in the development of place attachment. Furthermore, religion not only ascribes symbolic meaning to place, expressed through its physical location, architectural design, layout, and aesthetics, but also actively engages believers to experience history and geography (Mazumdar & Mazumdar, 2004). Visitors' experiences at religious heritage sites can be influenced by both objective environments and subjective interactions. The physical features of sacred places, such as the symbolic and emotional properties of religious buildings, statues, and rituals, create a powerful atmosphere that associates individuals with a god or gods (Huang, Pearce, & Wang, 2019). Place rituals are defined in religion as a series of actions through which places are repeatedly invoked, their sacredness is reaffirmed, and one's identification with the place is reinforced (Mazumdar & Mazumdar, 2004).

Mazumdar & Mazumdar (2004) argue that place can be an integral part of religion, and religion can play an important role in the development of place attachment. Place and space characteristics are important in religious place attachment. People develop attachments to sacred cities and sacred buildings, as well as natural places.

While the characteristics of a place can inspire and foster connectedness, spirituality, community, and peace, a person's connection to a place is not solely dependent on the characteristics of the place and can be learned through the process of religious socialization. In this context, important religious others, such as parents, educators, and peers, as well as the wider community of believers, can play an important role in identity formation, teaching through prayers and rituals, stories and symbols, as well as personal experiences of place (Mazumdar & Mazumdar, 2004). Environmental perception depends not only on the information available in the environment but also on the characteristics and actions of the perceiver (Ruback, Pandey & Kohli, 2008). As Mazumdar & Mazumdar (2004) point out, individuals can become attached to a place because a larger group to which they belong can make them believe that the place is important through collective activities such as prayers. In addition to this symbolic aspect, sacred places are important because religious socialization takes place there in the form of ritual, pilgrimage, and experience. Religion connects people to places through sacred acts, and these places connect people to religion because they are places where religion is learned and lived (Mazumdar & Mazumdar, 1993). The concepts of relationships and connectedness are important components of visitors' religious experiences at sacred places (Huang, Pearce & Wang, 2019).

The ideas of both 'sense of place' and 'place attachment' have been revitalized in the last decade with the emergence of non-representational approaches to embodiment, practice, and performance as concrete issues (Thrift, 2008). In this period of renewed intensification of work on the concept of place attachment, the book *The Shack*, which constitutes the fieldwork, was written simultaneously and later adapted to the big screen. Through this movie, a study was conducted on the effect of religion on place attachment.

2. MATERIALS and METHODS

The findings of the literature review showed that the vast majority of research in the fields of architecture and interior design focuses on secular spaces, while studies examining religious spaces are limited and scarce. In contrast to the limited research encountered in the literature,

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

the relationship between religious spaces and place attachment is revealed through many indicators depicted in movies. From a different perspective, the film analysis approach was used to investigate the impact of religion on place attachment, as the research is believed to have the potential to make valuable contributions to the existing literature. In the study, the 2017 movie "Baraka" was analyzed. Through the events and dialogues in this film, which deal with different natural and physical environments, the concept of place attachment was analyzed in comparison with the existing literature, and its relationship with religion was revealed. Henri Lefebvre (2014) stated that "space is never empty; it always contains a meaning" and that space is a tool to tell a subject and convey a message. With this in mind, space, which is one of the tools used to tell the subject in cinema, can give sub-messages directly or contextually with the way architecture is used. Cinematic spaces are created by bringing physical and experienced spaces to the screen in relation to and in connection with the art of cinema (Çam, 2016). While cinema is an environment in which an architectural design that does not exist in reality and is created as an imagination can be used, it can also be considered an art with methods that can leave an experiential perception for the audience about the existing architecture (Aksoy, 2010).

Considering the limited literature on sacred places and the approach to the subject, an analysis in light of the studies conducted by Mazumdar and Mazumdar (1993, 2004) was deemed appropriate.

3. FINDINGS and DISCUSSION

*"Who wouldn't be suspicious if a man claimed to spend the whole weekend with God?
In a shack..."* (Hazeldine, 2017)

The Shack (Young, 2007), a novel that William Paul Young wrote in 2007 and that director Stuart Hazeldine adapted for the big screen in 2017, tells the tale of a father going on a spiritual journey. The main character of the movie Mack is on vacation with his family when his young daughter Missy, is kidnapped and brutally murdered in a shack in the forest. Deeply grieving, one day Mack receives a mysterious letter signed by "Father", God, and is summoned to the shack where his daughter was murdered. Mack, whose religious faith has been weakened by the events of his childhood and who has no heartfelt connection with God, goes to the shack and spends a weekend with God.

In the study, the scenes in the movie were grouped and analyzed under three main headings. These were grouped as *Church Scenes*, *Shack Scenes*, and *Nature Scenes*, and they were organized according to the flow of the subject, not chronologically or in scene order.

Church Scenes

The first church scene in the movie takes place in Mack's childhood. We see that the church, which is located in a rural area, has been transformed into a customized space in an open and natural area by simply covering it and placing movable furniture inside.

In the scenes shown in Figure 1, Mack, who has not yet lost his faith in God, talks to the priest in order to reach God and complains to God about his father, who is one of the elders of the church, for his violence against him and his mother. Because his father is known and respected by everyone in the church, he thinks that Mack has disgraced himself, so he makes Mack read verses under a tree in the rain after church and commits violence against him. After this complaint to the priest, Mack loses some of his religious beliefs because he cannot get a positive

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

response from God. Mack, who is also responsible for the death of his father, has been carrying this burden throughout his life and has always been distant from religion and the church. The other two church scenes (Figure 2) in the movie focus on the present day and take place in a church in the city center.

Figure 1. Church scene

Figure 2. Church scene

These scenes show Mack before and after the death of his little daughter Missy, which deeply hurt Mack; in other words, before and after Mack met God. When we look at the church scenes that take place before Mack loses his daughter and meets God, we can see that Mack comes to the church every week with his family, but he only visits the church; he does not participate in the rituals there, and there is no sense of belonging or attachment between him and the church.

If we look within the space; at the beginning of the scene, we can see that the people who come to the church actually use the church as a meeting point, and later, as an example of the social development of the place attachment of religion, we can see that everyone who comes to the church sings together and socializes here. These rituals of place in this scene are actually defined as a series of actions through which places in religion are recalled over and over again, their sanctity is reaffirmed, and a person's identification with place is reinforced (Mazumdar & Mazumdar, 2004). In the scene (Figure 1), which takes place before Mack's meeting with God, Mack does not participate in the rituals performed in the church in spirit, even though he is physically present there, because he has not fully completed his religious belief, and unlike the others, he does not feel and internalize place attachment. Place rituals can play an important role in this internalization process. For this reason, place rituals function as reminders that inform and transform believers. Reminders can take the form of daily prayers and/or prayers on special occasions, as the movie also shows.

Figure 3. Stained glass windows in the church

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Another remarkable point in the scene (Figure 3) is the focus on two different stained glass windows in the church. In these stained glass windows, which are preferred in churches to make worship more mystical and ritualistic, one shows God and the other shows a cut, bleeding hand and the pain coming from it. The last church scene (Figure 4) in the movie takes place after Mack has met God and forgiven both himself and his daughter's murderer. In this scene, we again see everyone who comes to the church singing together with great enthusiasm, but this time Mack sings along with great sincerity and conviction, and church now means something else to him. After the last church scene, the film again focuses on the stained glass Windows (Figure 5). This time three different windows are shown. One of them is God, one is Jesus and one is the Holy Spirit.

Figure 4. Church scene

Figure 5. Stained glass windows in the church

It is possible to see alternative representations of traditional Christianity, spiritual ideas and teachings in the movie. The biggest example of this is the figure of God. The figure of God is presented as three different human (trinitarian) characters. The main god, the "Father", is a matriarchal, African-American, middle-aged woman associated with the house/hut space; "Jesus" is a young man from the Middle East, engaged in woodworking; and "Holy Spirit", also known as Sarayu, is an Asian, young woman engaged in gardening. Through these characters, the viewer is made to believe that the figure of God is not sexist, racist, or discriminatory.

Shack Scenes

The first shack scene (Figure 6) in the movie is the one in which Mack's little daughter Missy, who is always depicted as snowy, cold, gloomy, rundown, and broken down throughout the movie, is brutally murdered.

Figure 6. Shack scene

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

Mack, who is not yet a religious man, receives a mysterious letter signed "Father" that brings him to this shack, where he falls asleep and suddenly finds himself in the woods. Mack meets Jesus in the woods and brings him to a beautiful, well-kept, cozy shack (Figure 7). Here Mack meets God, the Holy Spirit, and the person he later learns is Jesus. Mack's religious beliefs start to form after this scene, along with his questioning about religion.

Figure 7. Shack scene

If a comparison is made between the hut where Mack's daughter was killed and the shack in the woods where God (Figure 8), Jesus, and the Holy Spirit live, the shack where Missy is killed is always shown as black, dark, cold, and gloomy. The other shack, on the other hand, is depicted as well-kept, warm, and green throughout the movie. This actually shows us Mack's inner guilt, pessimism, and anger, while at the same time showing his goodness, beauty, and faith in himself. In other words, this comparison is actually emphasized in the film as summer/winter, heaven/hell, good/evil, goodness/evil in him/evil in him.

Figure 8. Comparative shed scenes

Nature Scenes

When we look at the movie in general, we can see that places of belief are constructed in open spaces rather than closed spaces. Nature has the ability to be imbued with spiritual power and significance. Forests, lakes and mountains often evoke a sense of the divine or sacred and inspire a sense of awe. Nature is a resource that people can use to connect with the sacred and create spiritual feelings. Moreover, people often have a moral perspective that envisions the natural environment as sacred, either because it is a divine creation or because it is inherently sacred (Ferguson & Tamburello, 2015).

Figure 9. Nature scenes

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

As Mack leaves the shack and walks with Jesus through the cold, snowy forest, he is suddenly transported to a lush spring forest of colorful flowers (Figure 9). As he follows Jesus, he leaves the cold, dark places in his past and in his soul and sets out on his own journey of faith. The comparisons made in the scenes of the cabin and the shack are also made in the forest scenes.

Another of the nature scenes that are frequently featured throughout the movie is the depiction of the Garden of Eden (Figure 10). The Holy Spirit takes Mack to a garden. Mack is very impressed by this garden, but states that he finds it quite complicated and disorganized.

Figure 10. Nature scenes

Then the Holy Spirit says that he wants to cut down a plant because he wants to plant something very important and asks Mack for help. Mack can't understand why this perfect plant has to be uprooted, but he helps him to do it. The next day what will be planted here will actually be her daughter's grave. Forgiving himself and his daughter's murderer, Mack is reunited with his daughter by God and has the chance to bury her. And his daughter will continue to live as a tree of life in the Garden of Eden. Thus, for Mack, who leaves a part of himself there, the sense of belonging and attachment to place becomes stronger.

At the end of the scene, we see a bird's eye view of the garden area (Figure 11), which Mack finds complex and disorganized. In fact, the emphasis that there is an order in every chaos and that God is the designer of this order is made with the help of fractals, which are a modeling of nature. The garden with these fractal elements constitutes a depiction of the Garden of Eden for Mack, whose religious beliefs are beginning to form. According to Briggs and Peat (2001), nature, that is, life, shows a non-linear structure that includes periods of stagnation, fluctuations and sudden jumps. In other words, fractals are new ways of interpreting the world.

Figure 11. Tree of life and fractals

During the weekend with God, Mack enters many different natural environments and experiences some fantastic supernatural events. These supernatural events include walking on the sea, passing through a rock, or seeing his daughter in heaven through a waterfall (Figure 12). After experiencing these things, Mack forgives himself and his daughter's murderer within himself and gets free.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 12. Supernatural events

Mazumdar & Mazumdar (2004) presented a conceptual model to understand the complex links between religion, place, identity, and commitment. This model consists of three main headings: place and its physical characteristics, religious socialization, and individual and collective commitment.

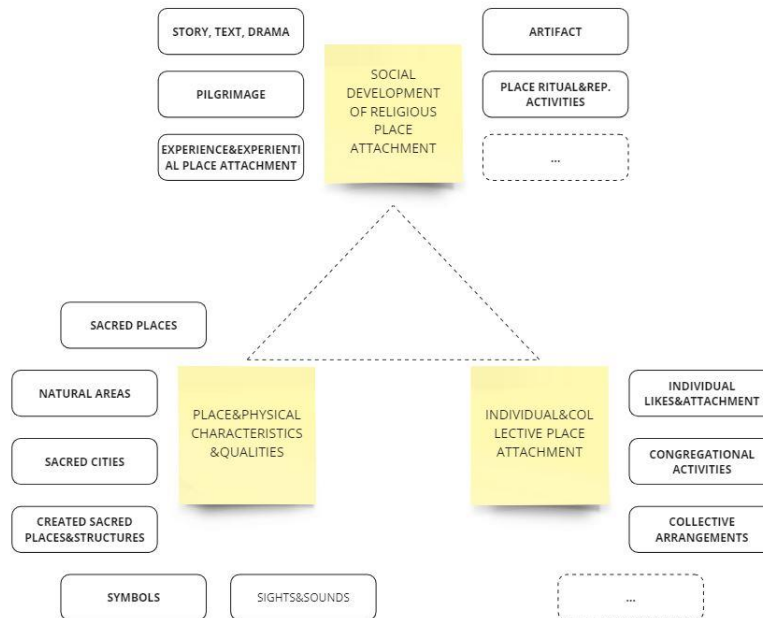

Figure 13. Religious place attachment: a model proposal (revisited from Mazumdar & Mazumdar, 2004).

The first heading, space, can be on a micro scale, such as houses, altars, shrines, tombs, cemeteries, temples, synagogues, mosques, or on a macro scale, such as regions or cities. They can also be places in nature, such as mountains, hills, lakes, rivers, rocks, or remote rural areas. The importance of places may stem from the qualities of the place, place-centered sacredness, or person-centered sacredness. Religion not only distinguishes these places from ordinary places by attributing symbolic meanings to them, It also has the potential to foster commitment, devotion, spirituality, disposition, morality, and worldview through its geography, design, or architectural aesthetics. The second heading, religious socialization, focuses on how attachment to religious space is taught and learned through phenomena such as ritual, story, text, drama, experience, and pilgrimage. The final strand of the model includes individual and collective components. Individuals acting collectively may develop a strong attachment to places that religion considers important or that the collective considers important. Likewise, individuals may develop individual attachments to religious places. Individuals may feel a stronger

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

attachment to a particular place or structure than others in that religion or collective, and in some cases, this attachment may be less intense or absent for an individual. Figure 13 shows the analyze of this conceptual model through the movie.

When we look at the title of location, physical characteristics, and qualities, we can see that sacred places in the movie are given together with frequently encountered natural areas. These sacred places include mountains, lakes, rocky areas, and rural areas, as well as depictions of the Garden of Eden and symbols such as the tree of life. In addition, examples of sacred structures are given with church scenes.

When we look at the social development of attachment to religious space, we see depictions of close friends talking and joking with each other in the church entrance scene and meeting in church every week as a ritual, everyone singing together in church, or church as a place where the family gets ready with great enthusiasm and goes to church.

When we look at individual or collective place attachment, we see that the movie includes both collective religious rituals and individual prayer scenes. It is also clear that in church scenes, individuals may feel a stronger attachment than others in the collective, and in some cases, this attachment may be less intense or absent for an individual.

4. CONCLUSION and RECOMMENDATIONS

It is clear that studies in the disciplines of architecture and interior architecture have hardly ever examined the issue of place attachment in sacred spaces, which is a topic that many disciplines address from various angles. Studies in the field of environmental psychology are somewhat more prevalent, but they are not sufficiently numerous. It is thought that conducting future studies in different scopes and addressing different disciplines will enable the enrichment and elaboration of the data obtained as a result of this study area.

When the literature on place attachment is examined, it is seen that most of the studies focus on secular spaces and environments. It is seen that the role of religion, sacred spaces, and place attachment studies is largely ignored. It is thought that religious places, places of faith, and sacred places should also be included in the literature on place attachment.

The findings of the comparative study conducted with the available literature and the film under examination indicate that environmental perception and the idea of place attachment are not just influenced by the individual user and the unique attributes of the location, but also have additional factors at play.

- The concept of place attachment is also related to place and religion, and it is inevitable that religion influences place and place influences religion.
- Additionally, a variety of place-related factors, such as prayers, rituals, stories, symbols, individual experiences, and beliefs, have an impact on them.
- Religious others (parents, educators, peers, etc.) and the community of believers can play an important role in identity formation.
- Personal experiences of place, subjective values and situations, relationships with faith, emotions, and spiritual values can also be effective in place attachment.

ABSTRACT

The concept of recycling has been around for decades, but its importance has become more apparent in recent years as we face environmental challenges such as climate change and resource depletion. Recycling is the process of reusing and reusing materials that helps reduce waste and conserve natural resources. Recycling has become an important component of product design and DIY as it helps support sustainability and reduce our impact on the environment. One of the benefits of recycling in design is the use of recycled materials. By using recycled materials in product design, companies can reduce their environmental footprint and conserve natural resources. Today, priority is given to recycled products not only in product design but also in facade design and even in art. However, recycling in design in general also has its challenges. One of the main challenges is finding reliable sources of recycled materials. Companies struggle to find consistent sources of recycled materials. While governments can offer incentives and support to companies that use recycled materials in their products, individuals can make a conscious effort to purchase recycled products and incorporate recycling into their projects. As a result, recycling plays a crucial role in promoting sustainability in design. Individuals and companies can reduce waste, conserve natural resources and encourage creativity and ingenuity by using recycled materials and incorporating recycling into their projects. With education and awareness, we can all play a role in promoting recycling and creating a more sustainable future.

Keywords: Waste Material, Recycling, Design, Product Design, Facade Design.

1. INTRODUCTION

It is the case that short-lived items turn into waste objects when the use time is over, that is, when the item becomes old and the state of usefulness disappears. The shortening of the use time of the goods has become more pronounced with the introduction of mass production completely depending on industrial developments. Mass production has developed in the age of industrialization, and accordingly, a disposable consumption style has emerged in post-industrial societies. Thus, it is seen that the so-called 'waste object' has come to the agenda with modern life (Yılmaz, 2015, 186).

The concept of waste refers to "all kinds of substances and materials that are not used, are not intended to be used, do not have any value and are thrown out". Wastes are generally classified as solid wastes, liquid and gas wastes, packaging wastes, and "substances that do not contain enough liquid to be fluent, should be disposed of in a way that does not harm human and environmental health, and do not work" are defined as solid waste. According to the sources, there are many recovery and disposal methods for solid wastes classified in four groups: domestic solid wastes, industrial qualified solid wastes, medical solid wastes, special solid

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium **September 14-15, 2023, Naples, Italy**

wastes. These can be sorted as reuse, recycling, recovery, incineration, composting, storage (Tandoğan, 2018, s.190).

Reuse is the reuse of waste in the same way "without undergoing any treatment other than cleaning". Recycling "is the introduction of waste into the production process as a second raw material after it has been subjected to physical and/or chemical processes". Recycling, on the other hand, is the process of using more than one by "converting the components in it to other products or energy by physical, chemical or biochemical methods by taking advantage of the properties of waste, including the concepts of reuse and recycling" (Tandoğan, 2018, s.190).

2. MATERIALS and METHODS

In this section, the study method, the model, universe and sample of the research, data collection techniques and data analysis are included.

In this research, while theoretical information about the subject is reached through literature research, limitations related to the subject have been introduced with the data collection tool developed specifically for the subject.

3. FINDINGS and DISCUSSION

As the world continues to face environmental challenges, it has become increasingly important to focus on ways to reduce waste and promote sustainability. Recycling is one of the most effective ways to achieve these goals and has the potential to radically change the way we think about product design and Do-It-Yourself.

It is possible to reuse building materials that have reusable qualities in various areas. The reuse of waste building materials is the recovery method with the highest resource and environmental protection due to the fact that it does not require any energy consumption. Structural wastes that are not suitable for reuse are also subjected to a number of recycling processes and are returned to sectoral applications. The structures built using these materials have a positive impact on the country's economy and sustainability (Çüçen & Altuncı, 2022, 193).

Recycling is the process of converting waste materials into new products. By recycling, we can reduce the amount of waste sent to landfills and incinerators, protect natural resources and reduce greenhouse gas emissions. When it comes to product design, there are a number of important benefits of recycling:

1. Reducing waste: By using recycled materials in product design and do-it-yourself projects, we can reduce the amount of waste that goes to landfills and incinerators. This helps to protect natural resources and reduce the environmental impact of our actions.

According to the information obtained from the research, policy makers are carrying out activities to increase the participation of the public in recycling activities, to inform and convince the public. The basic assumption that drives these activities is the fact that recycling will benefit the environment. However, it is not possible for administrations to maximize the benefits of recycling without realizing its potential negative consequences. For this reason, it is very important to go to waste reduction in recycling information studies and to explain the possibilities of reuse to individuals (Tufaner, 2019, 34).

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

2. Protecting natural resources: Recycling helps protect natural resources such as timber, minerals and water. By using recycled materials, we can reduce the need to extract these resources from the earth, which help protect natural habitats and ecosystems.

Waste has been expressed as the difference between the amount of resources owned and the amount needed Decently. Waste arises from the use of more resources than necessary or the inefficient use of resources. In everyday life, most individuals knowingly or unknowingly waste resources and damage natural resources. Therefore, the reduction of feelings related to wasteful consumption comes across as a process that precedes recycling activities (Tufaner, 2019, 34).

3. Reducing greenhouse gas emissions: Recycling also helps to reduce greenhouse gas emissions. When materials are recycled, it requires less energy than producing new materials from scratch. This means burning fewer fossil fuels, which helps reduce the amount of carbon dioxide and other greenhouse gases released into the atmosphere. Tue.

4. Promoting sustainability: By incorporating recycling into product design and Do-It-Yourself projects, we can promote sustainability and raise awareness of the importance of reducing waste and protecting natural resources. This can inspire others to take action and make sustainable choices in their own lives.

Jul Jul can contribute to waste management through information and awareness-raising activities in order to contribute to the country's economy in an effort to leave a sustainable clean environment and a clean world to future generations, especially with recycling that will suppress the feeling of extravagance. Especially in order to suppress the feeling of extravagance, it can contribute to waste management through information and awareness (Tufaner, 2019, 34).

Figure 1. Güell Park, Barselona-Spain, 1926 (Küplemez & Güngör, 2023, 48).

Gaudi used ceramic materials to be close to people and nature and achieved an artistic appearance with thousands of broken ceramic pieces. At the same time, the bench is both waterproof and health-friendly because it is covered with mosaic. One of the reasons Gaudí prefers ceramic material is that ceramic material is economical. Gaudi obtained the ceramics he used by using the waste parts of faulty products produced in factories. Color plays an important role in Gaudí's designs. Ceramic material offers convenience in providing a variety of colors and is also preferred due to its durability (Figure 2) (Küplemez & Güngör, 2023, 48).

Figure 2. Chybik+Kristof Architects & Urban Design, Brno, CZ, 2015-2016 (www.chybik-kristof.com, 2023)

The new furniture showroom is located on the outskirts of a public housing estate in Brno. The existing building was not suitable for the proposed function from a formal point of view. There are two sides to the concept; the first involves working with the interior and focusing on the presentation of a wide range of products that the company produces or distributes. The spacious interior is divided into sections by a system of spaces defined by suspended curtains. The second side of the concept solves the design of personnel facilities, consisting of offices, warehouses and technical and sanitary facilities. The new outdoor shell consists of the structure of the chairs produced by the company (<https://www.chybik-kristof.com/projects/gallery-of-furniture>, Erişim tarihi:17.07.2023).

Figure 3. Endless chair, Dirk Van Der Kooij, 2011 (dirkvanderkooij.com, 2023)

In 2011, the Endless chair was realized as Dirk van der Kooij's challenging graduation project. In a world first, he had reconfigured a pneumatic robotic arm to remove furniture from recycled plastic. The first series consisted of lightly colored plastic threads, shakily formed to form 3-D tapestries. A misaligned motor was creating a fistulous pattern, but it was also responsible for an unexpectedly veiled use of the technique (<https://dirkvanderkooij.com/endless-chair>, Erişim tarihi:13.07.2023).

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

One way to incorporate recycling into product design is to use recycled materials in the manufacturing process. This could include using recycled plastic, paper and metal to create new products. Many companies are already doing this, and it has become an important trend in the manufacturing industry.

Figure 4. Sculptural Design, Charlotte Kidger (www.charlottekidger.com, 2023)

Kidger is a London-based producer who researches how industrial waste materials can be reprocessed and transformed into sculptural and functional objects. Their furniture and home accessories are made of polyurethane foam powder, which is a waste material of creating industrial-scale 3D models on CNC machines, and hand-painted resin, which is cold poured into molds.

"Designers are starting to see waste as a new form of raw material due to the extraordinary volumes of various waste streams that surround us," he says. "Companies with materials that have no residual or residual value will have to install systems to ensure that these materials enter new production cycles."

Charlotte Kidger is a London-based UK Maker (b. 1992). Kidger graduated from Leeds College of Art BA (2014) and Central Saint Martins MA (2018) and has a background in Molding, Casting and Sculpture, based on industrial by-products. Her practice is led by a hands-on approach to exploring how these undervalued resources can be reused to reconnect people with our material world.

Often marrying unconventional sources and processes, he aims to reframe material values through carefully crafted works and installations. Ongoing research on material extraction, by-products and craft processes means that new ideas and concepts are constantly evolving. Charlotte hopes to bring alternative perspectives to new audiences through sensory experiences and storytelling (<https://www.charlottekidger.com/bio>, Erişim tarihi:20.07.2023).

4. CONCLUSION and RECOMMENDATIONS

Finally, we can summarize the key points we have mentioned and re-state the importance of recycling in product design. You can also offer some final thoughts or advice for readers who want to incorporate recycling into their own projects.

As a result, recycling is an important part of promoting sustainability and reducing waste. When it comes to product design, recycling has the potential to radically change the way we think about creating and consuming goods. By including recycling in our projects, we can help protect natural resources, reduce greenhouse gas emissions and promote a more sustainable future for everyone.

ABSTRACT

Architectural lighting is one of the important elements that determine the atmosphere and user experience of a building. Light, beyond creating an aesthetic effect in the exterior and interior spaces of architecture, is a powerful tool that has various physiological and psychological effects on people. Today, architectural lighting has become a design element that not only improves the appearance of a building, but also affects the experience of the users. As people build their daily lives to benefit from daylight, it has the potential to affect daily mood, energy level and general health. The use of daylight, which is of great importance for living things, also adds quality and function to spaces. However, natural and artificial lighting in religious buildings; It is used as an effective tool to emphasize the spirit, spirituality and meaning of places. The aim of this study; The aim is to examine the use of natural and artificial lighting and design elements on religious places. For this purpose, Edirne Hasan Sezai Mosque has been determined as an exemplary building. The existing natural and artificial lighting scheme of the building was modeled and simulated in the Dialux Evo lighting program. As a result of the study, it was observed that the natural and artificial lighting values on the ground floor were compared with the standards, and it was observed that the brightness value in some prayer rooms on the first floor, which could not receive natural light directly, was not sufficient for natural and artificial lighting.

Keywords: Lighting Design, Lighting in Religious Buildings, Edirne Hasan Sezai Mosque.

1. INTRODUCTION

Structures designed to fulfill the spiritual requisites of individuals are commonly termed as religious edifices. The fundamental objective of religious structures is to congregate individuals of the same faith, establish a conducive milieu for worship practices, and concurrently augment the pervasive influence of the given religion. These architectural constructs exhibit distinct variations contingent upon the unique attributes intrinsic to each faith.

Within these structures, the provisioning of physical and visual comfort prerequisites is imperative for the facilitation of purposeful actions. The formulation of an apt lighting design is achieved through the amalgamation of factors encompassing the judicious utilization of suitable light sources, manipulation of color temperature, and regulation of luminous intensity. Consequently, the luminous ambience cultivated within interior and exterior spaces assumes a pivotal role in upholding individuals' circadian rhythms, consequently exerting an influence on

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

the circadian systems governing diurnal patterns and endocrine secretions (Doğan, 2021, pp. 519-528).

2. MATERIALS and METHODS

This study notably underscores the necessity for accommodating visual comfort conditions within religious structures and accentuates the symbiotic relationship between the ethereal and mystical sentiments engendered by the architectural design and the quality of the illumination imparted. The primary aim of this investigation is to scrutinize the evolving role of technology in architectural design and dissect the simulation of both natural and artificial lighting within the architectural milieu using the Dialux Evo program. The overarching objective is to assess the adequacy of natural and artificial lighting within religious structures, preemptively discerning the essential prerequisites for artificial lighting within sacred worship spaces (Halıcıoğlu, Öztank & Vatansver, 2007, pp. 28-33).

3. FINDINGS and DISCUSSION

3.1. Visual Comfort And Illumination Within Mosques

Sacred architectural environments wield the potency to evoke profound emotional and physiological responses in individuals, owing to the orchestrated interplay of symbolic and material constituents in spatial configuration. These edifices primarily facilitate congregational worship and spiritual practices among adherents unified by shared convictions and sentiments. In this context, the seamless alignment of the philosophical underpinnings of faith with the tangible architectural milieu is of paramount import, as it engenders a cohesive conduit for the nuanced transmission of abstract tenets into experiential reality. Illustratively, the diffusion of natural light through fenestral apertures encircling the dome within mosques serves a dual purpose: it not only furnishes requisite luminosity to enable visual discernment, but also exerts a congregative influence, compelling the assembly to convene beneath the dome while augmenting the perceptual resonance of both the dome and its encompassing space (Cengiz, 2022). This intrinsic harmony between the enduring canonical morphology of mosque architecture and the intricacies of illumination design embedded therein affords an avenue to amplify the immersive ambience for worshippers, thereby endowing the architectural entity with an augmented spiritual resonance (Durukan, 2017). The spectrum of activities conducted within mosque precincts, encompassing prostration, supplication, recitation, and audile engagement with the Quran, transpire within a seated posture, each demanding a nuanced gradient of luminous modulations. Furthermore, in the realm of mosque architecture, the ingress of light through zenithal apertures in the dome periphery commonly serves to orchestrate congregational dynamics, directing the assembly toward the sacred core beneath the dome. Simultaneously, light filtrating through lateral walls encircling the mihrab and apertures punctuating the dome coalesce to focalize attention and bestow requisite luminance upon the designated domain reserved for the imam (Ünver, 2000). The imperative illumination thresholds germane to the spectrum of activities manifest within the sacred confines of mosque spaces are tabulated in Table 1.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Table 1. Proposed Determinations on Lighting Criteria in Mosques Inspired by Rengin Ünver's Work on Lighting and Religious Buildings (Demirkol, 2023).

Action Type/ Action Venue	Illuminance Measures		
	Illuminance	Luminous Quality	
	Illuminance Level (lm/m ²)	Action Plane (Position)	Illuminance Distribution
Reading	300	Yatay	Regional
Praying/ Mihrab (For the imam)	300	Vertical/ Horizontal	Regional/ Common
Praying/ Flooring	100	Horizontal	Common
Speaking/ Minbar	300	Vertical/Horizontal	Regionality

Internal lighting systems must inherently exhibit the requisite values and attributes outlined in the criteria provided in the table. In addition to general illumination, localized lighting is also essential to facilitate an enhanced perceptual understanding of the space. In the context of mosques, daylighting is primarily harnessed through numerous small windows present on the lateral walls and dome of mosques designed to benefit from natural lighting. However, the traditional load-bearing masonry construction technique employed in mosques often entails substantial wall thicknesses, thereby diminishing the luminous efficacy of natural light penetrating the interior space.

Concurrently, windows situated within the body walls of the mosque, generally commencing from an elevation proximate to the flooring level (approximately 0.40 m), contribute to providing essential luminosity for areas conducive to Quranic recitation, positioned close to the wall. Worship activities within the mosque, such as prayer and dialogue-listening, frequently occur upon the flooring surface, consequently, natural light entering through side windows augments the overall ambient luminance level (Direk & Oğuz, 2005). However, instances of inadequate or absent natural light have historically led to the utilization of artificial light sources such as candles, oil lamps, and the like within mosques. Typically suspended from various ceiling elements such as domes and vaults, these sources were often arranged in the form of pendant chandeliers or nested iron rings of varying sizes. Presently, analogous arrangements, featuring a height from the floor of approximately 2.5 meters, continue to be employed for artificial illumination within mosque interiors, now utilizing incandescent electric lamps (Oktaç, 1992). The ensuing section of the study addresses the fieldwork conducted, where the information presented in this section is comprehensively examined.

3.2. Field Study: Hasan Sezai Mosque in Edirne

In this study, the comprehensive exploration of natural and artificial illumination levels in religious structures was undertaken. The existing state of the structure was initially simulated, followed by a discussion on potential scenario alternatives.

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

3.2.1. Location and Architectural Features of the Structure

Hasan Sezai Dergah is recorded to have been established in 1428. According to Badi's Hadayik-ül Haikaik Fi Tekmilet-ül Şekayik, the lodge, initially constructed with a wooden roof and a single minaret, was commissioned by Şah Melek Bey (d. 1441) and recognized as the 'Şah Melek Lodge' (Yöre Dergisi, 2003). As illustrated in Figure 1, the Dergah is situated southwest of the city, within the transitional area influencing the Talatpaşa Neighborhood urban conservation site (Benian & Mısırlı, 2020).

Figure 1: Urban location of Hasan Sezai Dergah (Google Maps, 2023)

Figure 2: View of the Dergah from the Garden (Demirkol, Burçin İrem Demirkol Photo Archive, 2023)

Hasan Sezai Mosque is positioned within the dergah, immediately to the right upon entering through the main entrance on Bostanpazarı Street, in front of Hasan Sezai Tomb. The structure exhibits a rectangular, two-story design (Figure 4 and Figure 5). Within it lies a rectangular gallery void, encircled on all four sides and demarcated by gallery floors supported by wooden columns (Benian & Mısırlı, 2020) (Figure 6-8).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

room', and currently serves as a classroom. The structure is covered by a pitched roof, however, the interior of the roof features a 'bağdadi' dome. The mosque's façade exhibits a sequential arrangement of windows on both levels (Figure 11-13).

Figure 11. Mosque north facade

Figure 12. Mosque northeast facade

(Demirkol, Burçin İrem Demirkol Photo Archive, 2023)

Figure 13. Mosque southeast facade (Demirkol, Burçin İrem Demirkol Photo Archive, 2023)

3.2.2. Current Illumination Status of the Structure

The illumination within Hasan Sezai Mosque is derived from the window openings on the ground and gallery levels. The sequential arrangement of window openings around the ground level facilitates a maximal intake of daylight within the structure. However, sufficient illumination remains insufficient. Among the prayer rooms positioned along the edges of the gallery level, some feature window openings, while others lack apertures to the exterior. To address this, intermediary window voids have been introduced in rooms without direct daylight access, allowing for the transmission of natural light. Additionally, in certain linear rooms, intermediary windows have been integrated to capture natural light for rooms not directly illuminated by daylight, capitalizing on the illumination received by the third-row room through its window opening.

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 17. Balcony level gallery void (Demirkol, Burçin İrem Demirkol Photo Archive, 2023)

Figure 18. Ground floor worship area (Demirkol, Burçin İrem Demirkol Photo Archive, 2023)

The Hasan Sezai Mosque features an interior adorned with a Bağdadi dome and a pitched roof covering, rendering the uppermost covering devoid of any window openings. Conversely, the mosque's design strategically guides daylight into the interior through lateral windows of the Bağdadi dome which is centrally planned, having two stories, a suspended ceiling, and an atrium, thereby bypassing the conventional openings of the dome. Furthermore, the mosque's white-colored carpets and walls enhance the reflection of natural light from the window openings, augmenting the internal luminosity (Figure 18).

On the ground floor, there are 13 windows, while the first floor comprises 7 windows, ensuring a direct intake of natural light into the worship area. Additionally, artificial lighting within the mosque is facilitated by lamps positioned at a height of 2.6 meters from the floor on the underside of the mezzanine. These lamps are thoughtfully placed along the middle of the windows to adequately distribute the illuminative effect of daylight within the space. In the worship area of the ground floor, artificial lighting elements are positioned within the walls between each window, while beneath the mezzanine, 11 lamps are situated in proportion to the lower floor, comprising 15 lamps along the walls. On the upper floor, the study and worship rooms are arranged along the south and west sides of the gallery void. Notably, there are no artificial lighting elements above the gallery void. The illumination for this area is provided by four lamps situated above the gallery void, encircling the first floor mezzanine. Each study and worship room on the first floor features ceiling-mounted lamps. Given the ample daylight that permeates the ground floor during the day, artificial lighting is dispensable. The worship rooms of the women's gallery, oriented towards the west, possess generously sized apertures that render artificial lighting unnecessary during daylight hours. In the southern sequence of worship

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

rooms, those with direct exterior-facing window openings require no artificial lighting during the day. However, for those rooms without exterior openings, artificial lighting is necessary and provided throughout the day. A widely used lighting analysis program, Dialux, which is versatile and functional, was employed for lighting calculations. In the subsequent section, the mosque's lighting simulation and findings through the Dialux Evo program are elaborated upon.

3.3. Illumination Analysis of Hasan Sezai Mosque: Natural and Artificial

During the modeling process, the general structure was developed based on factors such as inter-floor height, wall thickness depth, height differences of window openings from the floor, the number, location, and height of artificial lighting fixtures, as well as the colors of materials used within the structure.

Figure 19-20. Hasan Sezai ground floor and gallery floor plan natural light modeling

In the daylight natural illumination simulation of the ground floor, an examination of the misrepresentation of colors (Figure 21-22) reveals that the worship area's flooring reaches values of 100, 200, and 300 lm/m^2 . The misrepresentation of colors showcases the distribution of illuminance ratios within the space through a color scale, corresponding to the materials and angles of incidence within the interior. The green-colored areas observed in Figures 20 and 21 correspond to values ranging from 100 to 300 lux. The distribution of illuminance on the wall surfaces is predominantly at the 100 lux level. Thus, this depiction allows for an understanding of the distribution of illuminance levels.

Figure 21. Ground floor natural lighting representation in perspective

Figure 22. Ground floor natural lighting representation on the plan

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

In the daylight natural illumination simulation of the gallery floor, the areas adjacent to the window openings exhibit values of 100, 200, and 300 lm/m^2 . The region housing the balcony, situated at the same level as the teaching room and the worship room to the east, as seen in Figure 23 and Figure 24, is highlighted in orange to represent an illuminance value of 1000 lux. The central area displays an average illumination ranging between 100 and 300 lux. The distribution of illuminance on the wall surfaces is generally at the 100 lux level. The values indicated as green for the worship rooms in the southern region denote approximately 300 lux, while the values shown in blue represent 10 lux on the color scale. The areas of worship without windows exhibit significantly lower illuminance values. The illuminance level of the worship room depicted in purple, with an approximate value of 0.75 lux, is notably inadequate.

Figure 23. Balcony level natural lighting simulation
Figure 24. Balcony level natural lighting simulation

Figure 25. Incorrect colors display on the ground floor plan
Figure 26. Ground floor plan perspective incorrect colors display

In addition to natural lighting analysis, artificial lighting data has also been measured in the study. In the evening hours after sunset, in the artificial lighting simulation of the ground floor, the illuminance provided by the luminaires in the worship area, as depicted in Figure 25 and Figure 26, is reported to be approximately 108 lux in the lighting report (Figure 27).

Figure 29. Balcony level incorrect color display

In the absence of daylight on the gallery floor, in a purely artificial lighting simulation, as seen in Figure 28 and Figure 29, it is observed that the illuminance level of the western area's bay-windowed lecture room and the two adjacent ordered prayer rooms falls within the range of 100-200 lux. For the row of prayer rooms in the southern area, rooms with window openings exhibit an average illuminance of 200 lux, while those without window openings are observed to have an approximate illuminance value of 70 lux.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

4. Evaluation and Conclusion

Natural lighting constitutes a significant factor influencing the atmosphere of religious structures. The quantity, quality, and direction of light influence the worship experience within spaces. In this study, the natural and artificial lighting values of Hasan Sezai Mosque were simulated using the Dialux Evo program for data analysis. In this context, the natural lighting potential of Hasan Sezai Mosque was assessed through an analysis of sun movement, employing simulations generated solely using daylight data. The results of the natural lighting simulation indicate an illuminance range of approximately 100-200 lm/m² for the ground floor prayer area. The observed natural lighting value on the ground floor aligns with references drawn from a limited number of studies in the field as identified through literature research (Ünver, 2000; DIB, 2021).

Interior Lighting Standard Values in Mosque Planning and Design (T.C. Cumhurbaşkanlığı Diyanet İşleri Başkanlığı, 2021).

Table 2. Interior Lighting Standard Values in Mosque Planning and Design Have Been Prepared by Inspired by the General Lighting Values of the Presidency of Religious Affairs and Rengin Ünver's Lighting and Religious Buildings (Demirkol, 2023).

Action Type/ Action Venue	Minimum Standart Illuminance Level (lm/m ²)	Natural Lighting Values of Hasan Sezai Mosque	Artificial Lighting Values of Hasan Sezai Mosque
Praying/ Mihrab (For the imam)	300 lux	100 lux	100 lux
Praying/ Harim	100 lux	100-200 lux	108 lux
Speaking/ Minbar	300 lux	300 lux	600 lux
Praying/ Mahfil	300 lux	100-300 lux	120 lux
Management Association Room	300 lux	0.75-10-300-1000 lux	20-30-100-750 lux

In the simulation of first-floor natural illuminance values, it has been observed that the gallery void possesses an illuminance level ranging approximately between 100-200 lux, and this value is consistent with the mosque's illuminance values. Rooms within the prayer area that lack daylight openings to the exterior exhibit illuminance levels below the standards.

As a result of the artificial lighting simulation for Hasan Sezai Mosque, the existing luminaires' placement on the wall surfaces adjacent to window openings and in the upper ceiling zones between the ground and gallery floors has been observed to provide localized and dense illumination to the ground floor prayer area, resulting in an average illuminance of 100-200 lux. It is suggested that this level of illuminance suffices to meet the mosque's illuminance requirements. However, these simulations indicate that employing luminaires with diffusing characteristics instead of localized light sources for the lighting fixtures on the ground and gallery floors could be recommended to mitigate regional lighting spikes and create a more soothing ambiance within the religious space.

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

The design of both natural and artificial lighting in religious structures constitutes a pivotal aspect that influences both the architectural and spiritual experience. A well-designed lighting scheme can emphasize the aesthetics of interior spaces, enhance the spiritual atmosphere, and elevate the worship experience. Proper analysis of the potential of natural lighting and careful selection of artificial lighting strategies hold critical significance in achieving successful lighting designs for religious buildings.

ABSTRACT

Konya has hosted many civilizations throughout its history and has been one of the important state centers of the Ottoman Empire. The city has many historical and cultural heritages. Monumental mosques are valuable elements of religious and cultural architectural heritage. In this respect, in this study, monumental mosques built in the Ottoman Period in Konya are handled. Mosques represent a central area where people gather for their daily and weekly prayers. They are used simultaneously in a specific region and time zone. This situation has an impact on the energy demand depending on the climatic regions during the heating and cooling periods of the building. In this respect, providing the comfort conditions in the interior space in an energy-efficient method is important and should be handled. This study, it is aimed to create and document the inventory of monumental mosques and to research the mosques in terms of energy efficiency. Architectural design properties and construction techniques of mosques are explained and energy analyses are made by using the DesignBuilder simulation program. The relationship between design properties and the energy demands of mosques is handled. It is aimed to show the importance of monumental religious buildings in terms of energy efficiency.

Keywords: Ottoman Architecture, Monumental Mosques, Energy Efficiency.

1. INTRODUCTION

Monumental mosques have great importance in terms of religious and cultural architectural heritage. Creating an inventory of these buildings is important for the protection of cultural heritage. Konya has been one of the most important main centers of Turkish-Islamic culture and art in Anatolia throughout its history. The city has preserved its importance for many years as the capital of the Anatolian Seljuk Civilization and as it is one of the important state centers of the Ottoman Empire. The city has many historical and cultural architectural heritages (Baykara, 2002). Mosques built during the Seljuk and Ottoman Periods provide the formation of the city morphology and create an important typology with their architectural design properties. In this respect, in this study, monumental mosques built in the Ottoman Period in Konya are handled.

Mosques represent a central area where people gather for daily and weekly prayers and are considered a place for the educational, cultural, and social activities of Muslims. They are characterized by their unique working hours. Mosques are used simultaneously in a certain region and time zone. They are used intermittently, five times a day and weekly. This situation

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

has an impact on the energy demand of the building depending on the climate regions during the heating and cooling periods required (Al-Homoud et al., 2005). In addition, it is of great importance that the comfort of the user in a religious mosque building in terms of the sense of sacred worship. It should be possible to worship in a comfortable area for worshipers. In this respect, providing the comfort conditions in the interior space in an energy-efficient method is an important object and should be handled.

Climate-related design properties of buildings affect the comfort conditions and thermal performance of the building (Abdou et al., 2005). Mosque energy efficiency largely depends on the overall thermal performance of building components such as walls, roofs, and windows working together as a system (Al-Homoud et al., 2009). In a mosque with low thermal performance, more energy is consumed to provide comfort conditions. In the study of Al-Homoud et al., indoor comfort conditions were analyzed for three mosques located in the hot humid climate zone of Damman, Saudi Arabia. The relationship between these conditions and the consumed energy loads was evaluated. It was determined that only one of the mosques had a thermal insulation layer in the envelope. It was reported that two uninsulated mosques had higher levels of energy consumption and dissatisfaction in terms of thermal comfort. In conclusion, the importance of integrating a thermal insulation layer was emphasized (Al-Homoud et al., 2009).

In a study conducted to determine the factors affecting energy efficiency in mosques, contemporary literature on energy use in mosques was analyzed. As a result of the study, it was stated that the building envelope design and climatic factors are the most important factors in the energy use of mosques and that heating-cooling systems constitute a large amount of the energy consumed in mosques. At the same time, the study compared studies aiming to reduce energy consumption and studies aiming to increase energy efficiency. As a result, it has been stated that energy use can be reduced by optimizing the design and operational strategies of mosques (Azmi et al., 2021).

This paper, it is aimed to create and document the inventory of monumental mosques and to research the mosques in terms of energy efficiency. Studies in this area are limited. In this respect, this study is pioneering and will light on future studies. In this respect, it is aimed to contribute to the studies within the scope of energy efficiency and mosques, to investigate the current energy needs of buildings, which are important elements of the monumental architectural heritage built centuries ago, and to show the importance of mosques in terms of energy efficiency.

2. MATERIALS and METHODS

This study is prepared within the scope of the Scientific Research Project (BAP) and among the analyzed mosques and masjids, monumental mosque structures built in Konya during the Ottoman Period are handled. These are the Şerafeddin Mosque (17th century) and Kapu Mosque (19th century). First of all, using the analyzing technique in the literature, information about the mosques belonging to the Ottoman period, and Konya city are collected. The buildings are visualized with the drone and their features are documented with photographs. Drawings in the electronic environment are taken from the Konya Regional Directorate of Foundations and colored, and their current situation is based on on-site determinations and their relations with their immediate surroundings are processed on the drawings.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

The plan, section, facade, roof cover, and interior space elements are explained and design typologies are determined in the light of the information in the literature, drawings, and visuals. At the same time, the construction technique and material properties are explained. Mosques' architectural design features were documented and modeled in the Design Builder simulation program. Models specific to mosque structures that have characteristic features are developed in the DesignBuilder simulation program, taking into account the users, occupancy rate, and usage times. According to the simulation results, the heating-cooling and total energy loads of the mosques are analyzed. An evaluation is explained according to the findings.

3. FINDINGS and DISCUSSION

In this section, the architectural design properties of the Şerafeddin Mosque and Kapu Mosque built in the Ottoman Period and their energy loads according to simulation results are explained.

a. Ottoman Mosques' Architectural Design Properties

- Şerafeddin Mosque, 17th Century

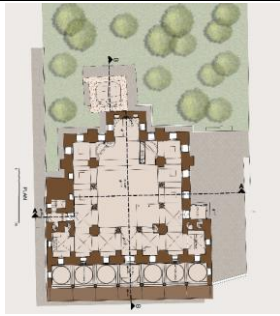

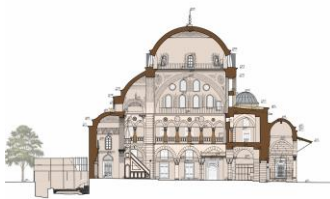

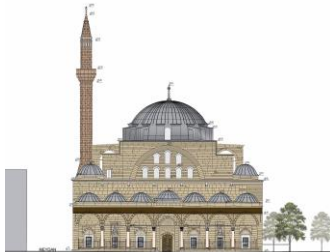

Şerafeddin Mosque is located in the east of Alaeddin Hill. The mosque was built according to the central domed plan scheme. The dome is supported by four large and six small pillars, and the dome is supported by a half-dome in the south. It is noteworthy that the building has been given height with the cover system. The covering system on the exterior is perceived by the main dome. It is remarkable that the building has been given height with the cover system. The covering system on the exterior is perceived by the main dome (Toktaş, 2016). Photographs belonging to the Şerafeddin Mosque are shown in Figure 1 and the architectural design properties of the Şerafeddin Mosque are shown in Table 1.

Figure 1. Şerafeddin Mosque (Photographs by the authors, 2019)

MINARET	Bond Technique	Masonry	
	Material	Cut-stone	

• **Kapu Mosque, 19th Century**

Kapu Mosque is located in the city center of Konya. It was built in 1658 by Pir Hüseyin Çelebi. The first construction, which is thought to have a brick masonry bond dome, was destroyed for unknown reasons. It was rebuilt in 1811 by Abdurrahman Efendi. In the fire of Konya Bazaar in 1868, it was completely burned along with the stores around it. The mosque was rebuilt using stone materials by the grandson of Abdurrahman Efendi and with the help of the people of Konya. Kapu Mosque is the largest mosque built in Konya during the Ottoman period and has the characteristics of classical Ottoman mosque architecture. The mosque is made of stones mass on a square plan and the top is covered with eight domes of different diameters (Kapu Camii- KONYA, n.d.; Konyalı, 2007; Muşmal & Çetinaslan, 2009). Photographs belonging to the Kapu Mosque are shown in Figure 2 and the architectural design properties of the Kapu Mosque are shown in Table 2.

b. Energy Analysis of Ottoman Mosques

In this section, the Şerafeddin Mosque and Kapu Mosque belonging to the Ottoman Civilization, are analyzed in terms of energy efficiency in light of the literature review and simulation results. Mosques are modeled using the DesignBuilder simulation program. Design

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Builder is an EnergyPlus-based software tool developed to measure and analyze the performance of building design in terms of energy, carbon, lighting, and comfort (Zhang, 2014).

Konya is located in the temperate-dry climate region of Türkiye. In terms of energy efficiency, the period when heating is required in temperate-dry climate regions is important. Design parameters affecting the energy performance of a building are handled as the location and orientation of the building, the distance between buildings, the form of the building, the optical and thermophysical properties of the building envelope, and the solar control and natural ventilation layout. It can be said that energy-efficient design parameters are also valid for a mosque structure. However, mosques have characteristic design properties that affect the basic design such as qibla, qibla wall, mihrab, and minbar. In this respect, the orientation of mosque buildings is the direction of the qibla. The orientation of the Konya mosques (their qibla), which are handled within the scope of the study, is in the south direction.

Şerafeddin Mosque and Kapu Mosque have a detached order property. Passively benefiting from or being protected from the effects of sun and wind changes depending on the settlement texture and distance between buildings. This should be considered as a factor that is important in terms of solar radiation gain and natural ventilation and therefore affects the energy load of buildings. In this respect, building order should be handled as a factor affecting the energy load of mosque buildings. In terms of building form, the form of mosque buildings is square or rectangular, which should be in the temperate-dry climate zone. Other architectural design properties affecting the energy loads of Şerafeddin and Kapu Mosques and the heating-cooling and total energy loads of the mosques per m² are shown in Table 3 for comparative analysis.

Table 3. Architectural properties and energy loads of Şerafeddin and Kapu Mosques

Mosque Name		Şerafeddin Mosque	Kapu Mosque
Total Area of Mosque m ²		714.47 m ²	1183.53 m ²
Mosque height (h)		24.14 m	16.60 m
Wall Material		Stone	Stone
Wall Thickness		150 cm	100 cm
Top Cover Material		Brick	Brick
Top Cover Thickness		67; 57; 35 cm	Hybrid Roof
Window-Wall Ratio (%)	South	7.27	9.87
	North	6.25	45.50
	East	6.81	9.87
	West	11.74	12.16
Cooling Load per m ² kWh		36.00	24.9
Heating Load per m ² kWh		215.52	176.83
Energy Consumed per m ² (heating-cooling-lighting) kWh		257.93	208.53

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

In terms of the top cover, Şerafeddin Mosque has a dome and the Kapu Mosque has a hybrid roof. In this respect, it can be said that the top cover is one of the factors affecting the differences between the energy loads of the mosques. In terms of building materials, Şerafeddin Mosque's building materials are stone and the wall thickness is 150 cm. Kapu Mosque's building material is stone and the wall thickness is 100 cm. Stone building material has the qualification of contributing to the heating and cooling loads of buildings in terms of thermal performance. It should be noted that the thermal conductivity properties of the opaque and transparent components of the building envelope are important parameters that can affect the energy loads of the buildings. The thermal conductivity of the wall varies depending on the building material properties and wall thickness. Period differences between the Şerafeddin and Kapu Mosque, the type of stone material used, differences in wall thickness of mosques, and the type of glass used in the openings should be handled as factors affecting the thermal conductivity of the wall. It can be stated that the building materials used in the analyzed mosques have the qualification of reducing the energy load of the buildings. In this respect, mosques' envelope properties should be evaluated as the parameter that affects the energy needs of mosques.

The opening ratios of Şerafeddin and Kapu Mosques vary depending on the directions. Directional openings are important factors in terms of solar radiation gain and natural ventilation layout. It should be noted that openings in the south direction provide direct solar radiation gain, but multi-directional openings cause heat losses. In this respect, it can be said that the openings depending on the directions have an impact on the differences between the energy demand of the mosques. In addition, monumental mosque buildings' volume should be handled and evaluated as an important factor.

As a result, the parameters affecting the energy load of a mosque building make differences in mosques' energy loads, especially the envelope design, building material used, wall thickness, facade openings depending on directions, and size of the building. As a result, it can be said that more positive results are obtained in terms of energy efficiency for both mosques although the differences between the energy loads.

5. CONCLUSION and RECOMMENDATIONS

In this study, monumental mosques built during the Ottoman Period in the city of Konya, one of the most important main centers of Turkish-Islamic culture and art, are investigated in terms of energy efficiency. Şerafeddin Mosque and Kapu Mosque belonging to Ottoman Civilization are handled. The architectural design properties of monumental mosques have been documented. The energy consumption of the mosques is analyzed.

The amount of energy consumed per m^2 of Şerafeddin Mosque is 257.93 kWh, and the amount of energy consumed per m^2 of Kapu Mosque is 208.53 kWh. The energy demands of mosques vary depending on their architectural design properties. It should be noted that with these

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

differences, positive results are obtained in terms of energy efficiency. It can be said that mosque buildings, which are important elements of the monumental architectural heritage built in the Ottoman period, are energy-efficient buildings in line with today's energy needs and traditional design features and construction techniques. In addition to energy analysis, building volume is an important factor in monumental mosque buildings in terms of energy efficiency. In this respect, it has been determined that the DesignBuilder simulation program, which calculates the energy load per m^2 , is inadequate for mosques where volume is an important factor, and volume-related analysis results are required.

As a result, it can be said that monumental mosque structures are valuable and important structures in terms of energy efficiency in line with the energy loads consumed per m^2 . Considering the limitations of studies on the energy demands and energy efficiency of monumental mosques, it is expected that this study will create potential research scopes for future research. In addition, documenting and protecting religious and cultural heritage and analyzing it in terms of energy efficiency has great importance in guiding mosques that will be designed as religious and cultural architectural elements with minimum energy requirements.

Information Note

ABSTRACT

The construction industry is responsible for a significant amount of energy demand globally. Building energy consumption and associated emissions have a great impact on the environment. In this respect, the construction industry has enormous potential to minimize its carbon footprint and the environmental performance of a building throughout its lifespan is an important issue. The environmental impact of buildings is measured LCA is an environmental management tool that holistically and systematically analyzes a product' or process' environmental impacts based on the energy and resources that they require throughout their lifespan. Structural elements are an important percentage of the total building material. The decision regarding a building's structural frame selection therefore has a major impact on the building's environmental impact. In this respect in this study, it is the purpose to explain and to compare steel and reinforced concrete framed buildings in terms of life cycle environmental impacts in the light of literature. It is aimed to emphasize the importance of structure selection in terms of solutions to environmental problems.

Keywords: Lifecycle, Environmental Impact, Steel and Reinforced Concrete Frames.

1. INTRODUCTION

Buildings account for a large amount of energy consumption and greenhouse gas emissions. Greenhouse gas emissions resulting from the use of fossil-based resources cause environmental damage such as global climate change, disruption of ecological balance, and destruction of natural resources. The depletion and destruction of these resources are also among the important problems. Building materials and components cause harmful effects on the environment with the natural resources they consume throughout their life cycles and the harmful emissions that occur at various stages of this cycle. The environmental impact is mainly related to resource consumption and emissions. In this respect, energy consumption is a widely used important measure of the buildings' environmental impacts (Fay & Treloar, 2003).

Assessment of the environmental impact of buildings or products throughout their lifespan is measured by Life Cycle Assessment (LCA). LCA is an environmental management method that systematically and holistically evaluates the environmental impacts of a product or process. Evaluated variants include resource use as well as various emissions to soil, water, and air. The emissions mostly caused by a building product are CO₂, CH₄, SO₂ (sulfur dioxide), Nox (Nitric

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

Oxide), and C_2H_6 (ethane). CO_2 causes global warming, SO_2 and NO_x cause acidification, and ethane and methane cause photochemical oxide formation (Aydın & Sancak, 2005). Important climate changes are significantly related with increasing atmospheric concentrations of certain gases, especially carbon gas. Most of the carbon dioxide emissions that cause the greenhouse effect occur due to the use of fossil fuels for energy production and consumption (Çoban & Kılınç, 2015).

Structural elements constitute the largest percentage of the total building materials and have a greater environmental impact than most other building elements, such as cladding, flooring, and roofing (Stek et al., 2011). Therefore, the structural framework decision of a building has a major effect on the environmental impact of the building. In this respect, this study aims to emphasize the importance of structural frame selection in terms of solutions to environmental problems. The reinforced concrete frame is handled in terms of Türkiye's building stock, and the steel frame, which is a recyclable and widely used material and which has a significant impact in terms of load-bearing, is handled.

2. MATERIALS and METHODS

In the study, firstly, using the analyzing technique in the literature, environmental impact and life cycle assessment (LCA) are systematically explained. The steel and reinforced concrete structural frames are explained within the scope of life cycle assessment in terms of energy consumption and related environmental emissions. Studies in the field of comparative analysis of steel and reinforced concrete framed structures are analyzed. In this direction, an evaluation is made.

Steel and Reinforced Concrete Frames in Scope of Life Cycle Assessment (LCA)

Buildings cause a great burden on the environment due to the consumption of large amounts of energy, and greenhouse gas emissions resulting from the building materials production and the operation of the building system (Xing et al., 2008). In recent years, to measure the effects of important environmental impact factors and effectively recommend improvement precautions, LCA-based building environmental impact assessment models have been developed (Su et al., 2017). A building is analyzed throughout its lifespan with the Life Cycle Assessment method in terms of resource use and environmental emissions. As an important tool of environmental management, LCA is an internationally accepted method.

Life Cycle Assessment can be defined as analyzing and evaluating the inputs, outputs and potential environmental impacts of a product or system throughout its life cycle (Zuo et al., 2017). The LCA method analyzes different possibilities and scenarios to minimize resource and energy consumption and reduce the environmental footprint of building materials (Oladazimi et al., 2020). LCA analysis methods are basically handled in four different ways in the literature: process analysis, process-based hybrid analysis, input-output analysis, and input-output hybrid analysis. A building consumes energy in the form of operational and embodied energy over its lifespan. Operational energy is the energy required to provide comfort conditions interiors of buildings. It is a sum of energy used for heating-cooling, ventilation, lighting, hot water supply, and equipments (Cabeza et al., 2014). Embodied energy is the energy required for the production of building materials, construction, maintenance and repair, and all activities at the demolition stage over the life cycle. Studies highlight the importance of both operational and embodied energy of buildings throughout their lifespan (Fay & Treloar, 2003). In this respect,

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

building design and structure selection are of great importance for the studies in the scope of reducing greenhouse gas emissions at the national level. The life cycle stages of a building and its relations are shown in Figure 1.

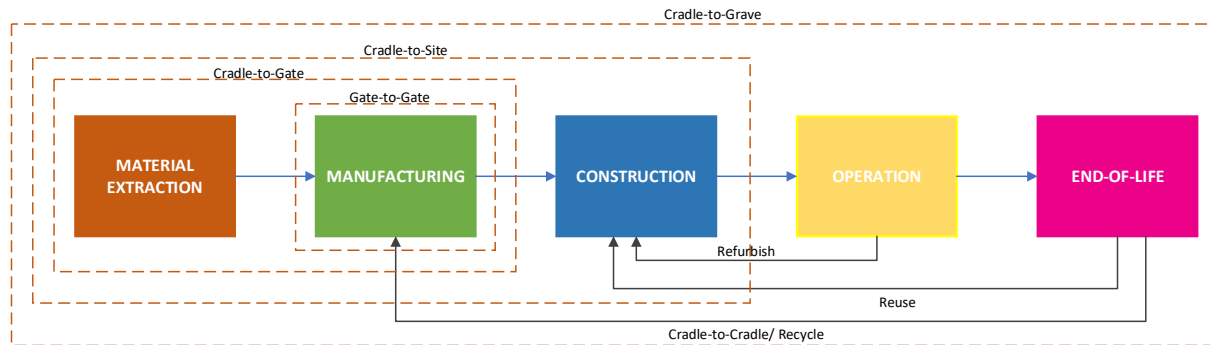

Figure 1. Life Cycle Stages of a Building (Simonen, 2007)

In terms of structural frames, steel and reinforced concrete building materials have embodied energy and greenhouse gas emissions such as carbon in the stages of their life cycle. Embodied energy is in the formation of the building material. It largely depends on the type of material used, primary energy sources, and the conversion efficiency of building material production processes (Koç et al., 2022). The embodied energy of a building is basically the energy used during the production of building materials and components and during the construction, maintenance/repair and demolition of the building.

Embodied energy is the sum of embodied energies of initial, recurrent, and demolition. Initial embodied energy indicates to the total energy used to extraction of raw materials, products and components produce and transport, and construct a building. Recurrent embodied energy is the energy demand to maintain or repair the building while it is in the use stage. Recurrent embodied energy depends on how the building is used by users, users' maintenance demands, the service life of the building, and the lifespan and materials and components quality. Finally, demolition energy indicates the total energy consumption to destroy the building, recycling and reusing some components, transporting waste to landfills, and disposing of others at the end of its life cycle (Azari & Abbasabadi, 2018). Life cycle stages and their scopes as factors affecting embodied energy and carbon loads throughout the life cycle of structural frames are shown in Figure 2.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

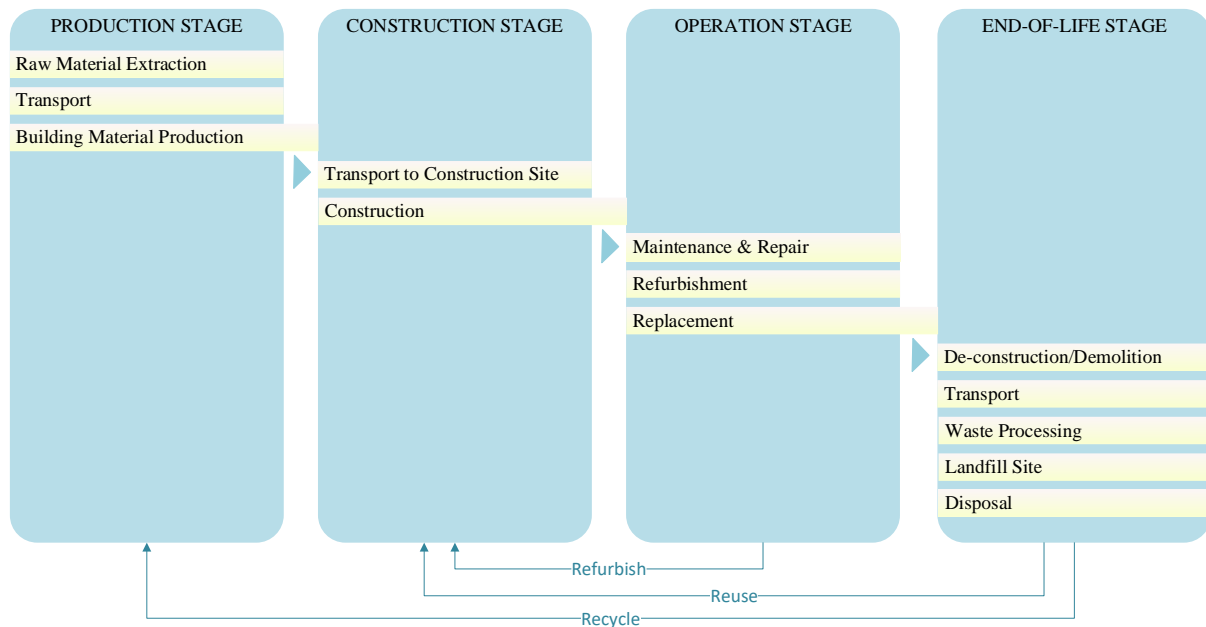

Figure 2. Life cycle stages and scopes in terms of structure

Steel is an alloy obtained from iron. Structural steel used in load-bearing systems is formed by adding 0.2-1% carbon and other additive materials to iron ore. Rivets, bolts, or welding methods are used as connection elements in the steel structure system. After the iron is extracted, melting, rolling and casting forming methods can be used in the manufacturing phase. Cold-formed galvanized sheet profiles are used in light steel load-bearing systems. Steel building material is accepted 90% recyclable or reusable during the demolition phase (Eren & Başarır, 2013). At the same time, waste can be used as a byproduct or energy.

The reinforced concrete structure consists of concrete and steel reinforcing bars. Concrete consists of approximately 60-80% aggregate, 10% cement, and 15% water. By-products used in concrete are fly ash and blast furnace slag. The environmental impacts of the energy and emissions used in concrete manufacturing are largely due to cement. The rate resulting from aggregate is approximately 3%. Evaluating the environmental impacts of concrete and concrete products depends on the material and energy flows that occur throughout their life cycle. Factors causing these effects: the use of fossil fuels, the use of natural raw materials, the use of land, and the use of energy (Aydın & Sancak, 2005).

Studies in the Scope of Life Cycle Assessment of Steel and Reinforced Concrete Structural Frames

In this section, studies in the scope of comparative analysis of steel and reinforced concrete framed structures in terms of environmental impact are explained. In Xing et al.'s study (Xing ve diğ., 2008) the environmental impacts of two different office buildings in China, steel and concrete frame, are compared. In this direction, a life cycle inventory model has been developed for office buildings. The aim of the study is to identify and to measure the energy consumption and environmental emissions of two typical office buildings throughout all life cycle stages. Environmental impact categories are handled as energy consumption, greenhouse gases and main pollution emissions (general emissions and urban emissions). In this study, BESLCI program developed by Huang is used as the LCA software tool. The lifespan of the buildings is

50 years. As a result, it is seen that the steel-framed building has better performance than the concrete-framed building in terms of life cycle energy consumption and environmental emissions. However, during the usage stage, the energy consumption and emissions of the steel-framed building are higher than the concrete-framed building. The study states that the energy consumption of the steel-framed building during its use stage will be reduced if thermal conservation can be improved.

In Kim et al.'s study (Kim et al., 2013) the environmental impact of steel and reinforced concrete structural frames is analyzed. In the research conducted on steel and reinforced concrete framed four buildings (two high-rise and two low-rise buildings), the amount of CO₂ emissions and energy consumed are estimated using input-output analysis. Four office buildings are located in Seoul. Analyzed input materials include cement, sand, gravel, formed steel, steel sheet, and steel plate. The results show that reinforced concrete building frames have 26% less CO₂ emissions and 29% less energy consumption than steel frames. It has been stated that most of the emissions originate from the steel production process. The study also analyzes construction and carbon emission costs, and as a result, it is found that the total cost of the reinforced concrete framed building is approximately 9.8% lower than the steel framed building. In this study, the difficulty of comparing studies in detail has been noted due to the scope of this study is limited to the input materials used in different structural frames, and the lack of definition of what is included in total energy estimates.

In Oladazimi et al.'s study (Oladazimi et al., 2020) the comparative life cycle of steel and concrete structural frames is handled and two multi-story residential buildings in Iran are investigated. A six-story reinforced concrete building and a seven-story steel building are analyzed. GaBi LCA Software (Version 8.7) is used in the study. The lifespan of the structures/buildings is handled as 50 years. All stages of the life cycle are analyzed. The construction stage data are obtained from the designers and contractors of the buildings. The necessary data for raw material extraction, material production and end-of-life stages are obtained from international and regional sources. Since the research focused on comparing the structural frames, other elements such as walls and floors are accepted to be similar. In this study, while the steel building structure is considered 100% recyclable after demolition, the steel reinforcing bar used in the concrete building is considered 85% recyclable and all concrete waste is landfilled. Environmental impacts are handled as global warming potential, eutrophication potential, resource depletion (water and mineral), acidification, human toxicity, fossil fuel consumption, climate change, air acidification and biotoxicity. As a result, the total pollution of the concrete frame is higher than that of the steel frame in all the specified impact factors. A concrete building created more waste/pollutants, therefore this results in a higher environmental impact. Steel building has a more harmful impact on the ecosystem than concrete building in only one category, resource consumption (fossil and renewable resources, minerals). Additionally, the two stages extraction of raw material and end-of-life generated more pollution than any other life cycle stage. In addition, the biggest contribution in terms of non-organic emissions is CO₂ and the biggest contribution among organic emissions is methane. Findings show that choosing a steel frame is more environmentally friendly than a concrete frame.

In Balasbaneh & Ramli's study (Balasbaneh & Ramli, 2020) a comparative life cycle assessment of concrete and steel prefabricated buildings in Malaysia is handled. The buildings are evaluated according to five environmental impact categories using SimaPro 8 software. These impact categories are greenhouse gas emissions, respiratory inorganics, non-renewable

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

energy, mineral/raw material extraction, and land use. According to the findings, the emissions of steel structures are higher than concrete structures only in the greenhouse gas category, while the emissions of concrete structures are higher in other environmental categories. Electricity use for equipment is found to be greater for steel than for concrete in all categories. Material wastage for concrete is higher than for steel in all categories. Recycling and reuse can reduce total emissions from steel frames. Using steel can minimize waste and therefore contribute to reducing environmental impact. The study also analyzes these two buildings in terms of life cycle cost-efficiency. As a result, although the cost of the construction stage of the steel prefabricated building is higher, the overall cost of the concrete prefabricated building is higher in terms of life cycle cost.

3.FINDINGS and DISCUSSION

The main properties and outcomes of the studies examined within the scope of the study are shown in Table 1.

Table 1. Studies on the environmental impact of steel and reinforced concrete frames

References	Year	Environmental Impact Categories	LCA Phases	Main Results
Xing et al.	2008	Energy use, greenhouse gas emissions, basic pollution emission	All LCA phases	The steel-framed building has better performance than concrete-framed building. However, during the operation stage, the energy consumption and emissions of the steel-framed building are higher than the concrete-framed building.
Kim et al.	2013	Energy use and CO2 emission	Manufacturing phase	Reinforced concrete building frames have 26% less CO2 emissions and 29% less energy use than steel frames.
Oladazimi et al.	2020	Global warming potential, eutrophication potential, resource depletion, acidification, human toxicity, fossil fuel consumption, climate change, air acidification and biotoxicity	All LCA phases	The total pollution of the concrete frame is much higher than that of the steel frame in all the mentioned impact factors except one. Steel building has a harmful impact than concrete building on the ecosystem in only one category, resource consumption (fossil and renewable resources, minerals).
Balasbanih & Ramli	2020	Greenhouse gas emissions, respiratory inorganics, non-renewable energy, mineral/raw material extraction, and land use	All LCA phases	The emissions of steel structures are higher than concrete structures only in the greenhouse gas category. In other environmental categories, emissions of concrete structures are higher.

When comparative analyses of steel and reinforced concrete structural frames are handled, there are studies in which both building materials have high or low performance in terms of environmental performance. In the light of the literature and in line with the analyzed studies, the reasons for the different results of the studies can be handled as focusing on different stages

III. International Architectural Sciences and Applications Symposium **September 14-15, 2023, Naples, Italy**

of the life cycle, differences in the methods and boundaries of the study, and environmental and structural properties. Ideally, all life cycle stages should be investigated to understand and evaluate the total environmental impacts of a structure. If all stages are not analyzed, information about which stage and why the effects occur can not be fully evaluated.

The steel-framed building has many obvious advantages compared to the reinforced concrete-framed building. For example, a steel-framed building is more convenient for protecting the environment because it produces less solid waste and can be recycled at the end of its life. The steel frame can also provide material efficiency. For example, structural steel elements can bear more load than other materials with smaller cross sections. In Eren & Başarır 's study (Eren & Başarır, 2013) is stated that the equivalent of a column of 100x100 cm in a reinforced concrete structure is 40x40 cm in a steel structure. This will increase material efficiency. However, it is not appropriate to state which type of structural frame is qualitatively and quantitatively energy efficient and environmentally friendly. Ideally, all stages of the life cycle and stages' relationships with each other should be analyzed to select a structural frame that has high environmental performance.

In terms of steel and reinforced concrete structures, different cost efficiencies can be observed at different stages of the life cycle. Life cycle cost, as with energy and emissions, should be investigated throughout the entire life of the structural frames. The cost of a building should be handled in line with parameters such as construction time, labour cost, maintenance/repair cost, and cost in terms of building material usage. Especially for the structural frame selection for an effective application area, the environmental argument must be supported in terms of cost.

4. CONCLUSION and RECOMMENDATIONS

In this study, steel and reinforced concrete frames are systematically explained within the scope of environmental impact and life cycle assessment. The studies in environmental impact context are investigated. In this direction, it is emphasized the necessity of studies on the evaluation of the energy efficiency and environmental protection performance of different building designs and structural frame selection based on the whole life cycle. The environmental impacts of a building's whole lifespan must be known and analyzed to build an environmentally friendly building. Life cycle assessment (LCA), which analyses and evaluates the impacts of all life cycle stages, is the best and most important method to achieve this goal. Building design and structure selection is an object that needs to be handled within the scope of environmental impact in order to solve problems such as global climate change and resource depletion. It is necessary to construct buildings that have high environmental performance by handling parameters such as the energy of building materials, reducing construction waste, reusing products, and using highly recycled materials.

Energy and environmental emissions are important parameters that need to be optimized due to their national and global importance. In the context of structural frame selection, more detailed quantitative studies are required to conclusively determine the impacts on energy and the environment. To select a structural frame that has high environmental performance, all stages of the life cycle and their relationships with each other should be analyzed. In a process where urban transformation is on the agenda, steel structures should be also handled together with reinforced concrete in order to construct buildings and frames that have high environmental performance and a decision must be made as a result of comprehensive environmental analysis.

ABSTRACT

The study examines the impact of the environment on the perception and appreciation of tall buildings. It also questions how perception and appreciation change when the quality of the environment changes. The working hypothesis is that the environment and the quality of the environment will be effective in the perception and appreciation of a building. In line with this objective; eight (8) tall building forms were determined with reference to the studies in the literature and these forms were modeled through the Sketchup program. Then the plots where the forms will be installed were determined. Ulus, consisting of low-rise historical buildings that form the backbone of the city of Ankara, and Kavaklıdere, consisting of high-rise modern buildings, were taken as reference. These lands were also modeled through the Sketchup program. After both building models and environmental models were produced, the images were mounted together using Photoshop. In this way, a total of 24 images were obtained: eight (8) single buildings, eight (8) buildings mounted in historical environments and eight (8) buildings mounted in modern environments. These images were shown to the final year students of Gazi University Department of Architecture and they were asked to evaluate the images within the scope of the variables of liking, impression and complexity. As a result, it was found that the environment has an effect on the perception and appreciation of a tall building. The environment decreases the impressiveness of the forms, increases their complexity and decreases their appreciation. Tall buildings are appreciated more and found more impressive in a modern environment.

Keywords: Tall Buildings, Environment, Impressiveness, Liking, Complexity, Perception.

1. INTRODUCTION

1.1. What is a Tall Building?

There is no universal definition of tall buildings in the literature. The definitions and height limits of tall buildings vary according to the structure of the buildings, construction systems, fire and earthquake regulations, building standards, professions and specialties (Ali & Armstrong, 1995; Yıldız, 2023). When various guidelines on tall buildings are examined, it is seen that definitions are shaped depending on many criteria such as land and road widths, urban silhouette, surrounding structures and visual impact. The height limits of buildings also vary considerably from one city to another. Table 1 shows the height limits and definitions of various cities. Accordingly, a 4-story building in a historic city is considered a high-rise building, while a 4-story building in a modern city is considered a low-rise one. In cities such as Chicago and Los Angeles, where high-rise buildings were first developed, the minimum height limit is 20

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

stories. In cities such as London, where high-rise buildings develop in a more controlled manner, relative height is determined instead of setting any height limit. In other words, height limits are determined according to sub-regions determined as a result of urban analysis, rather than covering the entire city. When the building definitions in the table are evaluated, the fact that the building is significantly higher than the surrounding buildings and that it can be distinguished in the urban silhouette are effective in defining it as a tall building. In addition, in some cities, land and road widths are also influential in determining building heights and forms. All these definitions emerge as a result of the specific relationships that tall buildings establish with cities. In each city, developments are shaped depending on urban data.

Table 1. Definitions of tall buildings and height limits in various guidelines

City	Definition	Height	City	Definition	Height
Bristol	Structures that are significantly taller than their surroundings and/or change the city skyline	>9 floor	Merton	Buildings whose height is greater than the road width of the neighboring street or the wider of two intersecting streets	Relative height
Burlington	When carefully designed and positioned, they are unique elements of the city character and skyline.	>11 floor	Nelson Mandela	A building that is 50% or more higher than the surrounding buildings within an area of 100 meters in diameter	>8 floor
Cambridge	Any building that stands out from the existing city skyline and is taller than the surrounding buildings	>6 floor	New Castle	A building that stands out from the city skyline and/or is significantly higher than the surrounding buildings	-
Cardiff	Buildings that have the potential to create significant value in the city	>8 floor	Northampton	A building that stands out from the city's skyline and/or is significantly higher than the surrounding building stock	-
Hackney	Buildings or structures that are significantly taller than their surroundings	>10 floor	Pickering	The building consists of a podium with active areas and a lobby on the ground floor and a tower with living areas, condominiums and office spaces on the upper floors	>13 floor
Los Angeles	-	>20 floor	Ottawa	-	>10 floor
Hamilton	Buildings that are taller than the width of the neighboring street and exhibit slenderness depending on the context they are associated with	>12 floor	Toronto	Buildings whose height is greater than the road width of the neighboring street or the wider of two intersecting streets	>12 floor
London	Buildings that dominate the local and city silhouette with their presence and impact as they increase in height	Relative height	Worting	Structures that are significantly taller than their surroundings and/or change the city skyline	>7 floor

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

When the definitions and height limits of tall buildings in our country are examined in the light of these definitions; it is understood that the definitions are shaped according to the limited data determined by the standards and regulations. In the Istanbul Zoning Regulation (2007), a tall building is defined as "a type of building that generally affects its immediate and distant surroundings in terms of physical environment, silhouette, urban texture and all kinds of urban infrastructure. It is defined as "buildings with a building height of at least 60.50 meters at the lowest level visible from any facade of the building". In the Planned Areas Zoning Regulation (2018), high-rise buildings are defined as 'buildings with a building height of more than 21.50 meters or a structure height of more than 30.50 meters are high-rise buildings. Buildings with a building height of more than 52.50 meters or a structure height of more than 60.50 meters are very high buildings'. In the New Turkey Building Earthquake Regulation (2018), buildings with building height class 1 are considered as high-rise buildings, while the height limits according to the earthquake design class are determined as $H > 70$ meters for 1st and 2nd class, $H > 91$ meters for 3rd class and $H > 105$ meters for 4th class (AFAD, 2018). Therefore, although the height limits in the regulations have been increased over time, the relationships of the buildings with the urban environment are ignored in the definition of tall buildings. As a result, when evaluated in the light of guidelines and regulations, tall buildings are complex structures that are very difficult to define. According to urban data, height limits and height perception vary considerably. In order to eliminate this complexity, the Tall Buildings Council (CTBUH) has developed three (3) criteria for defining tall buildings; contextual conditions, building proportion and technological advancement of the building (Figure 1). A building is considered tall if it meets one or more of these criteria.

Figure 1. Height criteria according to the Tall Building Council (CTBUH, 2023)

In this study, based on the definitions in the guidelines and the CTBUH's proposal, tall buildings are defined as buildings that are significantly higher than the surrounding buildings, distinguishable in the urban skyline, slender in terms of building proportion and technologically innovative.

1.1. Tall Building Forms

Tall buildings can be classified in various ways in terms of form. While orthogonal forms such as squares, rectangles and circles were common in the 19th century, when tall building construction first emerged, today quite complex forms can be produced thanks to the possibilities of technology and construction systems. Therefore, due to the difficulty of classifying tall buildings in terms of form, classifications have been developed according to various parameters. Inspiration from computer commands (Vollers, 2008); shaping according to structural and energy efficiency principles (Taghizadeh & Seyedinnor, 2013) and shaping according to aerodynamic effects (Kim & You, 2002; Irwin, 2009; Amin & Ahuja, 2010; Amin & Ahuja, 2010; Tanaka et al., 2013; Ilgın & Günel, 2021) are the parameters according to which tall building forms are frequently classified. Especially aerodynamic loads are very effective in

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

determining the form as they are one of the most exposed loads as the height of the building increases. In this study, eight (8) basic form categories were determined for tall buildings with reference to the studies in the literature; simple form, circular form, hyperbol form, tapering form, layered form, opening form, conoid and twisted form (Figure 2).

Figure 2. Tall building forms

1.3. What is the Environment and the Impact of the Environment on Tall Buildings

Environment, in the most general sense, is the physical, biological, social, economic and cultural environment in which humans and other living things maintain their relations and interact with each other (Berkes & Kışlalıoğlu, 1990). The urban environment is the environment where people's interactions are shaped with all its physical components such as streets, squares, avenues, houses, sculptures, parks and architecture. Urban environments create a whole and unique character with their natural factors such as topography, climate, vegetation and geological structure (Ocakçı, 1995). Historical environments are places that reflect the social, cultural and economic structure, philosophy of life and aesthetic concerns of past civilizations. They are places where culture and historical accumulation are revealed, and which illuminate the past by bringing the architectural styles, technological developments, interactions, experiences and cultural achievements of past periods to the present day (Arabacıoğlu & Aydemir, 2007).

The urban environment and especially the historic environment have many effects on tall buildings. In fact, this is a mutual interaction and the effects of tall buildings on the environment are generally questioned. In this study, unlike generalizations, how the environment affects tall buildings is investigated. First, the environment plays a direct role in the perception of the building. A tall building must compromise with the existing urban environment. The scale of the building must solve the problem of the image of the city, its relationship with the surrounding structures, and mass (Beedle et al., 2007). The character of the surrounding structures and open spaces is important in whether the building is perceived as high, low, dominant, naive, or overwhelming. In an environment consisting of low-rise historical

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

buildings, a high-rise building is perceived as more dominant and overwhelming as it separates from its surroundings, while in an area surrounded by multi-storey buildings, the building becomes more noticeable as it separates from its surroundings. Features such as the location of the building, material selection and form are also very effective in the perception of the building. Location and site selection can enable the building to be adopted as a reference point within the area. When the material selection of the building is in harmony with the environment, it creates a value within the area, while the use of incompatible materials can destroy the effect of the building. The environment creates a framework for defining a building and determining its boundaries. In addition, a sense of closure is necessary in defining streets and avenues (Özer, 1992).

Environment is effective in determining the form of tall buildings. High-rise buildings are generally shaped in a tripartite configuration called base-middle-top (Sev, 2009). The environment is effective in shaping this form. The base part of the building is usually the part related to the street. By keeping this part wider than the upper parts, the building is prevented from creating a dominant effect on the environment. Single masses, on the other hand, have a more dominant effect on the environment and negatively affect the human scale. However, single masses are the most appropriate form of construction for buildings on narrow parcels. Therefore, parcel and land conditions are also effective in determining the mass and form of the building. Topographical features of the environment, vegetation, underground and surface water resources, transportation and infrastructure systems are other factors that influence the shaping of tall buildings.

When the studies on the effect of the environment on the perception and appreciation of buildings are examined in the literature, the effect of geology, topography, and local environmental character on the design of buildings is questioned through the complexity variable in Bovill's study in 1996. In Heath, Smith & Lim's (1993) study, tall building facades were evaluated according to complexity and silhouette variables. The impact of the environment was not questioned in this study. In Imamoğlu's (2000) study, traditional and modern residential facades were evaluated through the variables of liking, complexity, and familiarity. It was found that there was an inverted 'U' relationship between complexity and liking. In other words, a moderately complex image was preferred more than very complex and less complex ones. In Stamps' (2002) study, the relationship between the silhouette line of the built environment and the silhouette line of the mountains and hills was questioned. In Akalın et al.'s 2008 study, detached house facades were analyzed in terms of complexity, desirability, and impressiveness. In Erdoğan et al.'s study (2013), residential facades of different styles were analyzed in terms of familiarity, impressiveness, complexity and liking variables. Ostwald and Vaughan (2016) measured the visual diversity and complexity of different forms of representation (from simple to complex) on building facades. Lionar & Ediz (2020) examined the impact of urban background on the design of buildings. As a result, there are few studies in the literature that investigate the impact of the environment on

the perception and appreciation of buildings, and these studies generally examine residential facades. There is no study that evaluates the effects of the environment on tall buildings. The contribution and differentiation of this study to the literature is to classify high-rise buildings in a typology from simple to complex and to question the impact of the environment on perception and taste. The study evaluates two contrasting types of environments and questions how the quality of the environment affects perception and taste.

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

In the study evaluated on the form variable, tall building models were developed according to eight building forms obtained from the literature. These models were evaluated in terms of complexity, liking and impression by means of a questionnaire study, both individually and assembled in two different environments. The results show whether the environment influences the perception and appreciation of a building.

2. MATERIALS and METHODS

The study methodology is based on a questionnaire survey. According to the data obtained from literature studies, eight (8) building forms were determined; simple, circular, hyperbol, tapered, layered, opening, conoid and twisted forms (Figure 2). Each form was modeled with the Sketchup 2021 program. The building models have the same height (200 m), floor area (30-30 m), ground floor arrangement and roof area, but differ only in form. Then, the backgrounds (environment models) on which these models will be mounted are designed. In the study where both environment models were designed with the Sketchup program, their opposite qualities were decisive in the development of the environments. While one of the environments consists of historical, low-rise, ornamented, and detailed buildings; the other one consists of multi-storey, modern, simple and plain forms buildings. For this purpose, the buildings in Ulus and Kavaklıdere, two sub-regions on Atatürk Boulevard, which form the backbone of the city of Ankara, were used as reference. Two undeveloped plots of land were identified in both areas. High-rise building models were developed to be positioned on these lands. For the Ulus area, the land at the intersection of Atatürk Boulevard, Cumhuriyet Street and Anafartalar Street, which is currently planned to be demolished, was selected. In Kavaklıdere area, an empty land between the General Directorate of Foundations and Celal Bayar Business Center on Atatürk Boulevard was selected. Topography, roads and buildings that shape the character of both areas were modeled.

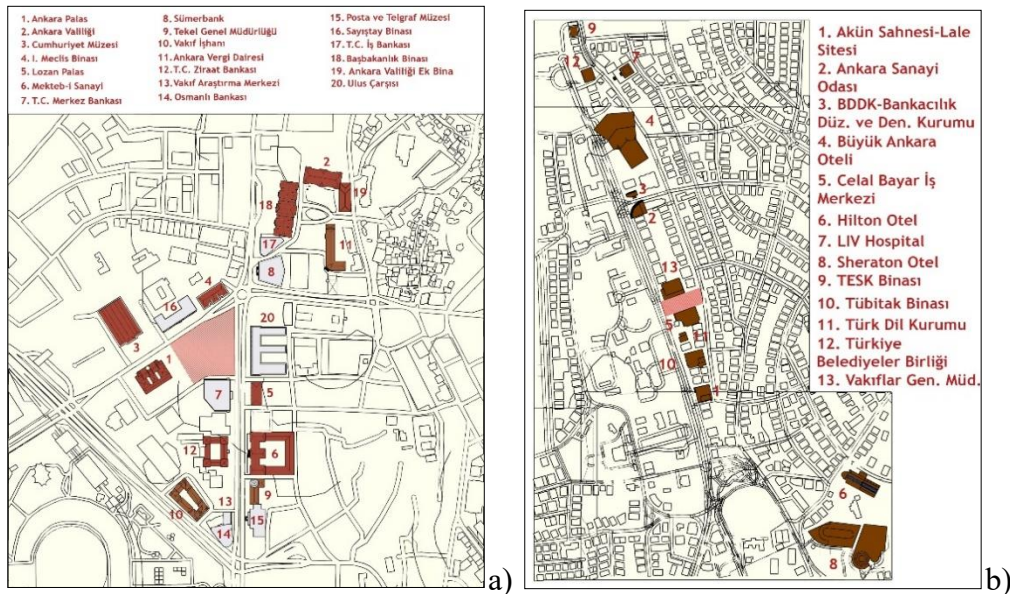

Figure 3. a) Ulus region b) Kavaklıdere region

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

After both building models and environmental models were developed, the images were mounted together using Photoshop software. In this way, a total of 24 images were obtained: eight (8) single buildings, eight (8) buildings mounted in the historic environment and eight (8) buildings mounted in the modern environment. In the study, the perspective of the images is arranged according to the urban perspective. Since only the ground floors of tall buildings can be perceived from the street, it was deemed appropriate to limit the study to an urban perspective.

Figure 4. Images used in the study

The survey was conducted with a total of 52 fourth year (4) students of Gazi University Department of Architecture. Since the study was conducted with a homogeneous group, the number of samples was kept limited. The images were shown to the students in the classroom environment by projecting them on the screen. The images are presented in random order. Each image was shown on the screen for 15 seconds and the students were asked to evaluate these images according to the variables of liking, impression and complexity. The survey was completed in a total of 6 minutes. The data obtained were analyzed with statistical methods in the SPSS program. The relationship between the variables was evaluated by correlation analysis and semantic differences were evaluated by Anova test.

3. FINDINGS and DISCUSSION

The reliability analysis of the dependent variables in the study was analyzed according to Cronbach's Alpha. The Cronbach's Alpha value of the impression variable is 0.96; the complexity variable is 0.89; and the liking variable is 0.9. Generally, a value above 0.7 is considered as an acceptable reliability value. Therefore, the dependent variables have statistically high reliability values. The study was conducted with a total of 52 participants. 65% of the participants were female students and 35% were male students. Before showing on to the visual questions, the participants were asked to indicate how effective the urban environment is in the perception and appreciation of a tall building. Participants were asked to rate their evaluations on a scale of 1: very unimportant to 5: very important. In response to this question, 56% of the participants stated that the environment was very important in the perception and

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

appreciation of the building and 36% stated that it was important. In other words, with a rate of 92% in total, the participants evaluated the environment as an important criterion in the appreciation of the building.

The proportional relationship between the participants' responses to the dependent variables (liking, complexity and affect) and the environment and form variables was analyzed. In the correlation evaluation, the correlation coefficient takes a value between 1 and -1. A value of 1 indicates a strong positive correlation, 0 indicates no correlation, and -1 indicates a strong negative correlation. Accordingly, there is a statistically significant relationship between impression and regions ($p < 0.05$). There is a significant relationship between impression and circular form (0.2 units), hyperbol form (0.22), tapering form (0.35), layered form (0.36), opening form (0.67), conoid form (0.39), and twisted form (0.69). There is a statistically insignificant relationship between complexity and regions ($p > 0.05$). There is a significant relationship between complexity and circular form (0.44), hyperbol form (0.31), tapering form (0.18), layered form (0.70), opening form (0.82) and conoid form (0.59). There is a statistically significant relationship between liking and regions ($p < 0.05$). There is a significant relationship between liking and circular form (-0.21), hyperbol form (0.24), tapering form (0.16), opening form (0.11), conoid form (-0.07) and twisted form (-0.19).

Table 2. The relationship between dependent variables and independent variables

In the study, Anova test was applied to reveal the significant difference of each variable. P values in the Pr(>F) column indicate whether the effect of independent variables on dependent variables is statistically significant or not. Region and Form variables contain significant differences as a result of ANOVA analysis.

The stars () in the output indicate the significance of the p-values. For example, if "****" is represented by two stars, the p-value is less than 0.001 and this result is highly statistically significant.

In the study, the effect of the environment was questioned through dependent variables. Firstly, when the graphical data are evaluated in terms of the impression variable (Figure 5), the presence of the environment had a negative effect on the impressiveness of the forms. The opening form, conoid form, twisted form, circular form and hyperbol form, which were impressive when evaluated individually, took lower values when evaluated together with the environment. The simple form was evaluated as more impressive with the environment. However, as a result, the environment negatively affected the impressiveness of the forms. The impression of forms is lower in Ulus than in Kavaklıdere. This is related to the fact that the buildings shaping Ulus are low-rise, detailed, and ornamented facades. Tall building construction is considered less impressive in the historic environment than in the modern environment.

Figure 5. Average values of variables in terms of impression

When the graphical data is evaluated in terms of the complexity variable (Figure 6), the presence of the environment had a positive effect on the forms. All forms were evaluated as more complex with the environment. Simple, circular, hyperbol, tapering, layered and opening forms, which were considered complex with the environment, were found to be less complex when evaluated independently of the environment. In terms of conoid and twisted forms, the presence of the environment had no effect on complexity. In Ulus and Kavaklıdere, the results showed a similar distribution. Both regions have similar values in terms of complexity.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 6. Average values of variables in terms of complexity

When the graphical data are evaluated in terms of the liking variable, the presence of the environment had a negative effect on the forms. When evaluated independently of the environment, the opening form, conoid and twisted forms were liked, while these forms received low values when evaluated together with the environment. When evaluated independently of the environment, the simple form was the least liked form, while it was liked when evaluated together with the environment. In addition, the Kavaklıdere district received higher values in terms of appreciation than Ulus. Tall building construction was liked more in the modern environment than in the historic environment. Therefore, the results in the graph show that the environment has a significant effect on the appreciation of forms. The environment decreases the impressiveness of the forms, increases their complexity, and decreases their liking. In the historical environment, the impression decreases, the complexity takes a neutral value and the liking decreases compared to the modern environment. Based on the results in the graph, it is understood that the environment has a significant effect on the perception and appreciation of the forms. The presence of the environment changes the level of complexity, impression and liking of buildings. The quality of the environment also has a significant effect on these variables. Tall buildings are more appreciated and more impressive in a modern environment.

Figure 7. Average values of variables in terms of liking

4. CONCLUSION and RECOMMENDATIONS

In this study, the presence and quality of the environment in the perception and appreciation of tall buildings are questioned. Although the history of tall buildings dates back to ancient times, there has been a significant increase in the production of buildings all over the world in the 21st century. The fact that tall buildings reflect the economic development, modern and innovative aspects of cities and contribute to the prominence of cities globally has increased the importance of these buildings. In parallel with these developments, the visibility of buildings in cities has begun to become more noticeable. Based on the increasing importance of tall buildings, this study examines how the environment affects the perception and appreciation of these buildings. In this context, tall building forms were determined for the study and these forms were mounted in different environments. Then, the values of the buildings according to the variables of impression, complexity and liking were compared.

As a result, it was determined that the environment was effective in the evaluation of building forms. The addition of environmental data affected the perception and appreciation of the forms. It had a negative effect in terms of impressiveness and made the buildings perceived as more complex. In terms of liking, both environments had a negative effect. In other words, while the buildings were liked on their own, their level of appreciation decreased within an environment. This situation has developed independently of the quality of the environment. Even in a modern environment where tall buildings can be compatible, they are not appreciated as much as they are appreciated on their own. The quality of the environment also had a significant impact on the variables. Tall buildings are more appreciated and more impressive in a modern environment. Therefore, these results show that the environment is very effective on the perception and appreciation of buildings.

This study was conducted on high-rise buildings. In future studies, the results can be improved by examining different building types/styles. The environment variable was limited to modern and historical environment. More comprehensive data can be obtained by diversifying these variables (e.g. natural environment data can be added). In addition, determining the criteria by which the environment influences the perception and appreciation of buildings would contribute to the expansion of the findings obtained in this study.

DEGRADATION OF ORGANIC EXTERIOR COATINGS IN THE FACE OF PHYSICAL ENVIRONMENTAL EFFECTS

ABSTRACT

All building materials have a limited lifespan and are subject to change and degradation over time, especially when exposed to the external environment. The durability of exterior claddings, which are constantly exposed to the external environment during the use process in buildings, has always been an issue that architects, building manufacturers, and users have always cared about. The main function of exterior claddings is to protect the substrate surface against corrosion and erosion. The duration of healthy use of exterior coatings varies depending on material quality, application quality and ambient conditions. This is called the durability of coatings. At the end of their useful life, they will be renewed. No organic or inorganic coating can last forever. Even inorganic coatings, such as electroplated coatings on aluminum, have limited durability. Organic exterior coatings used as topcoats on the facades of buildings are slightly more sensitive to physical environmental effects than inorganic coatings. The loss of protective properties of organic coatings generally occurs in two steps. The first of these is the decomposition of the material by physical environmental effects. The second is the loss of the ability of the coating to bond to the substrate as a result of attenuation and other effects caused by degradation. In this study, climate factors and related physical environmental effects will be defined, the factors among climate factors that are parameters for the deterioration of the properties of exterior pavements will be discussed, and the mechanisms that degrade organic structures and lead to adhesion weakening will be examined.

Keywords: Exterior Cladding, Physical Environmental Effects, Adhesion, Degradation.

1. INTRODUCTION

Organic exterior coatings are one of the material options that can be used as finishing on the exterior facades of buildings. As it is known, the main function of exterior coatings is to protect the substrate surface. For this, first of all, they must maintain their adherence with the substrate, be durable, and remain intact for as long as possible in the face of external environmental conditions.

Temperature changes, humidity, precipitation, U.V. radiation, pollution caused by oxygen and acid gases in the air are among the factors affecting the durability of an organic-based material faced with outdoor conditions. Among these, only oxygen is seen as a constant parameter. Other parameters may vary according to geography and regions and latitudes around the world.

When these regional effects listed above are considered in a wide area with their main lines, the concept called "macroclimate" emerges. For example, the Mediterranean climate is a macroclimate type. Furthermore, there is another type of climate that occurs on a small scale, very close to the building component in question, and plays an important role in determining the life of the material. This is called a "micro-climate". For example, dew formation is a

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium **September 14-15, 2023, Naples, Italy**

microclimate type. With dew formation, a continuous film of water forms on surfaces, usually during the cool night hours or in the morning. A further effect in the neighborhood of the substrate is the accumulation of acidic ions in the wet film formed by dew.

Solar radiation provides the energy required for winds, evaporation, temperature, atmospheric and oceanic cycles and similar climatic events that manifest themselves in various ways on Earth and in the atmosphere. It can be said that solar radiation is the locomotive of all these events and movements that determine the macro-climatic conditions. In the microclimate dimension, solar radiation has an effect that increases surface temperatures and changes the nature of organic substances, leading to differentiation of their internal structure characteristics.

The first effect of solar radiation on surfaces is temperature. This effect is mostly caused by long wavelength infrared radiation. Depending on the thermal properties, the degree of roughness and the angle of incidence of the rays, any surface receiving the sun will heat up more or less than the ambient temperature and cool down during the night hours.

A more important effect of solar radiation, especially on organic surfaces, is to disrupt the microstructure of the material. This effect is caused by short-wavelength ultraviolet radiation. According to the view confirmed by many scientists, the high energy that destroys all organic products is mainly caused by U.V. radiation. U.V. radiation first of all changes the microstructure of organic molecules and then changes the physical properties of the material. (Eduardo & Real, 2023).

The loss of protective properties of organic coatings generally occurs in two steps. The first of these is the decomposition of the material with physical environmental effects. This event is also called degradation. Degradation formation is mainly caused by U.V. radiation, water and oxygen effect and pollutants in the atmosphere and manifests itself as loss of gloss, color change, surface dusting, thinning of the film layer, hardening and brittleness. The second is the loss of adherence of the coating to the substrate as a result of weakening and other effects caused by degradation. (Philip & Schweitzer, 1999; Schulz, 2008).

Degradation Mechanisms

The destruction of organic building materials by U.V. radiation occurs in two ways. The first of these is that U.V. radiation initiates a reaction opposite to the polymerization reaction in which small molecules combine to form large molecules. (see Figure 1) With this reaction, covalent bonds are broken and large molecules disintegrate into small molecules. These micro-scale decompositions can be recognized by touching the coating surface. This is called surface dusting (or chalking).

Figure 1. Bond breaking reaction

The energy provided by U.V. radiation, with the active help of oxygen and water vapor in the air, breaks the cross-linked macromolecules into smaller and smaller pieces. (see Figure 2) This continues for months and years until the polymer molecules are so small that they can be dissolved in water or turned into gases. The resulting molecules are CO or CO₂ gases. (Knudsen & Forsgren, 2017).

Figure 2 Degradation and breaking down of molecules

As this process continues, the volume of the coating layer shrinks, the film thickness decreases and it loses its durability. With the transformation of long elastic macromolecules into short brittle molecules, the film layer loses its elasticity, hardens and becomes brittle. This brittle process starts near the outer region of the film layer and after a certain time two different structures are formed within the film layer;

- The area close to the outside that has become hardened and brittle,
- Relatively more elastic inner region that has not yet hardened.

However, the basic principle in the construction of a wall is the opposite. The rigid and stiff part should be on the inside and the more elastic layers on the outside. If there is a brittle, quick-drying top layer on top of an elastic substrate, cracks are often formed. After a while these cracks deepen and accelerate the degradation into the interior. Eventually the entire film layer peels and breaks.

The second degradation mechanism is a reaction along the carbon chain in organic molecules, breaking side bonds and forming new ones. This results in large cross-linked molecules. (see figure 3) In this case, brittleness increases and capillary cracks occur. At the same time,

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

molecules whose chemical structure changes during cross-linking cause more absorption of blue light in the visible region. Thus, the reflected light becomes closer to yellow. This manifests itself as a yellowing of the color when viewed from the outside. (Knudsen & Forsgren, 2017).

Cross-linking → Molecular expansion → Yellowing

Figure 3 Cross-linking and forming new molecules

Loss of Gloss

The first sign of structural deterioration of the coating film under outdoor conditions is dulling of the surface. After the application is completed, the coating surface may go through various phases such as full gloss, silky gloss, semi-gloss, semi-dullness and full dullness. (see figure 4) In the first phase, there is almost no light scattering on the smooth surface and the surface appears completely shiny. Meanwhile, the solvent evaporates into the air. The first phase may last a few weeks or a few months depending on the type of coating and weather conditions. At the end of this phase, the film layer loses the last solvent residues and signals the beginning of shrinkage. The large pigment groups pushed out of the surface during the initial shrinkage phase will scatter some of the light, causing a reduction in gloss of about 10%. This is normal for air-drying coatings. In the following phases, the scattering gradually increases and the surface becomes dull over time. (White et al., 2017; Philip & Schweitzer, 1999).

Figure 4 Time-dependent gloss loss and chalking curves on surfaces with different gloss levels (White et al., 2017)

The change in surface gloss over time can be easily determined. The gloss is measured at angles between 20° and 60° to the film surface and the reflection of light is measured periodically

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

depending on the angle and the values obtained are compared with a reference value. The reference value is a standard black glass surface, which is considered to be 100% glossy. (Silva et al., 2016)

Surface Dusting.

Surface dusting is a visible sign of degradation. It occurs as a result of the release of unbound powdery pigment particles on the film surface of organic coatings under atmospheric conditions. This is also called chalking. Surface dusting in a white alkyd coating, pigmented with TiO_2 at 15% pigment/volume concentration, can be seen in figure 5.

Figure 5 Surface dusting in a white alkyd coating (Philip & Schweitzer, 1999)

If we take a closer look at this phenomenon, 3 factors come to the fore: U.V. radiation, moisture in the air and Oxygen. When U.V. radiation combines with moisture and oxygen, the process of degradation of the organic structure begins. This manifests itself as surface dusting. The amount of moisture in the air and early morning dew play an active role in this process. The climates that cause the highest surface dusting effect are hot, humid and tropical climates with high U.V. radiation. In cold, cloudy, dry regions of the northern hemisphere or high mountains, surface pollution is relatively low. (Philip & Schweitzer, 1999; Schmid, 1988).

Decompositions and sheddings

One reason for the formation of cracks on the outer surface of air-dried coatings is the different drying rates of the layers. Under outdoor conditions, the outer zone dries faster than the inner zone. The pigment/volume concentration of the drying zone increases and the surface becomes more brittle. The high pigment/volume concentration of the brittle top layer on the more flexible substrate causes cracks. The brittleness of the outer layer is caused not only by the increase in pigment/volume concentration but also by the degradation of macromolecules. Intramolecular cross-linking and the degradation of binding molecules into smaller molecules lead to brittleness. In both cases, cracks appear in the outer layers of the paint layer. (Moncmanova, 2007)

Superficial cracks also occur when an incompletely dried oil primer is painted with a fast drying topcoat with a high pigment/volume concentration. These cracks lead to increased penetration of water, oxygen and U.V. radiation into the coating. This creates defective sections in the paint film layer, which accelerates the degradation of the paint system further inland. Eventually these cracks reach the substrate surface. Protection ends and corrosion and erosion of the substrate begins. After this stage, peeling and exfoliation begin.

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

The effect of the first days on an air-drying coating

Coating systems drying under outdoor conditions are very sensitive to environmental conditions during the initial stages of drying and the first days after application play an important role for the entire life of the film layer. This makes it somewhat difficult to predict the durability of coating materials. For example, water can enter the film layer at night due to dew formation and this creates a swelling. These swelling movements disrupt and slow down the film layer formation. The film layer becomes porous and poorly crosslinked. On the other hand, a warm and dry climate accelerates the drying process and resistance to U.V. degradation is gained more quickly. (Schurr, 1982).

Loss of adherence

In order of importance, loss of adhesion always comes before surface degradation. Surface degradation can be repaired by repainting. However, exfoliation and peeling of a coating system due to loss of adhesion often requires expensive repairs. The damaged areas must be scraped away and a sound surface must be obtained ready for reapplication. It can therefore be said with certainty that maintaining adhesion is a fundamental requirement for a successful coating system. Regardless of all other properties, a coating with strong adhesion to the substrate under atmospheric conditions will show greater durability than a coating with weak adhesion.

Loss of adhesion usually occurs after the degradation process has started. Therefore, degradation is considered to be one of the direct or indirect causes of adhesion loss. However, the adhesion mechanism is quite complex and each coating system behaves differently depending on its type, substrate and external environmental conditions. For example, there are examples of coatings that lose adhesion long after degradation has started, as well as coatings that lose adhesion as soon as degradation begins. This situation shows that effects other than degradation play a role in adherence loss. These effects include mechanical stresses, temperature changes, humidity and chemical effects. (Schurr, 1982).

Mechanical stresses are tensile stresses or shear stresses that occur as a result of any external impact or force on the coating layer, or as a result of small deformations of the substrate. These stresses affect the adhesion forces at the interface and the internal structure of the coating material.

Another reason for the rupture of the coating layers from the substrate is the different thermal expansion requirements of the outer coating and the inner layer in the face of temperature changes. This is the physical effect of temperature on the material and depending on the magnitude of the stress it creates, it can cause the coating layer to break away from the substrate in a short time or after a certain period of time by fatiguing the material.

Another important influence that causes the adhesion of the pavement layer to the substrate to weaken is air humidity. The effect of moisture can occur through dew formation or condensation. Water molecules penetrating between the coating and the substrate block polar groups on the surface of the substrate and in the coating, so that the molecules cannot achieve the necessary adhesion. It can be said that in humid environments, the adhesion of the coating layer to the substrate will be weaker than in a dry environment.

Another cause of loss of adherence of the coating layer to the substrate is chemical effects. Reactions caused by the penetration of any chemical into the coating layer and absorption up to the interface, or electro-chemical reactions that cause the formation of ions as a result of

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

water entering between the coating layer and the substrate can cause loss of adhesion. (Marrion, 2004; Stein & Lenz, 1973).

2. CONCLUSION

As a result, it can be said that the performance of organic exterior surface coatings depends on substrate and coating material properties, building envelope formation, application conditions and outdoor conditions. Therefore, when selecting the coating material, attention should be paid to be compatible with the substrate to which it will be applied and the climatic characteristics of the environment, to have the mechanical and physical properties expected from it, to be easy to maintain, renew and clean, to be durable and economical.

Internal and external effects within the external wall cause some physical phenomena to occur on the wall and this brings problems. Therefore, the layers that make up the wall must have some internal structure properties according to their location. When protecting buildings, applications are generally made by taking into account the visible signs on the exterior surface and impermeable materials are used as topcoat. These applications, which are made by ignoring the events in the inner layers of the facade, do not eliminate the cause of the physical events that destroy the building envelope from the inside and outside, and generally cause deterioration between the outer layer and the sub-surface and damage to the substrate together with the outer layer.

In the formation of the building envelope, water, moisture and salt carried by the plaster substrates should be prevented. For this purpose, wall layers should be selected so that capillary action and condensation do not occur in the exterior wall sections, if the application is made on a building that is still in use, condensation analysis should be performed, and if condensation occurs, it should be prevented with vapor barrier or heat insulation layers. The exterior cladding to be applied should have low water absorption and sufficient water vapor permeability. At the same time, organic facade coatings should be elastic enough to respond to small deformations and dimensional changes of the substrate and should be protected against U.V. radiation. It should be remembered that organic exterior coatings are sensitive to external influences in the early stages of drying, and that the environmental conditions during this time affect the entire life of the coating.

ABSTRACT

Theme parks are recreational areas that are typically designed around a specific theme, often centered on scientific, cultural, or historical subjects. These parks aim to provide visitors with an immersive experience by presenting their entertainment offerings within a story or fictional setting. In addition to offering recreational, entertainment, and educational opportunities, theme parks also play a significant role in shaping urban identity, promoting tourism, fostering economic development, generating employment, and supporting green infrastructure. This study aims to identify theme park types that will contribute to the development of Aydın city and its residents, provide various recreational activities, and raise awareness about history, culture, and nature. To achieve this goal, a survey was conducted using the Delphi technique with a panel of 22 experts, including landscape architects, architects, agricultural engineers, urban and regional planners, archaeologists, and local government representatives in the region. The experts were presented with a questionnaire that consisted of both open-ended and closed-ended questions. The responses were thoroughly analyzed, and a second questionnaire was formulated based on the findings. This second questionnaire was sent back to the experts to reach a consensus. According to the results, the experts identified the following types of theme parks as suitable for Aydın city: "Educational Theme Parks and Gardens," "Natural Life-Themed Gardens," and "Recreation and Entertainment Theme Parks and Gardens." These themes were synthesized by taking into consideration Aydın's natural and cultural riches, and their suitability for the city was discussed. Recommendations were made for the implementation of a theme park that would enhance Aydın's prestige, and tourism potential, and appeal to all age groups.

1. INTRODUCTION

Cities are defined as complex structures that constitute a significant whole with their tangible and intangible cultural values. When describing these structures, especially open and enclosed spaces, along with focal points, are among the foremost tangible values. These areas not only contribute significantly to the formation of a city's identity but also continue to do so as long as they maintain their sustainability. However, it's not only the spatial aspects but also social and cultural elements that shape a city's identity. In this regard, parks, which serve as urban elements and social spaces, contribute to the creation of a city's green space system, reflecting urban culture, facilitating urban communication, and enhancing the city's quality of life (Çanga and Yücesoy, 2019).

Parks are classified into various categories based on their functions, service areas, and locations, and this classification determines their contribution to urban quality of life (Emür and Onsekiz, 2007; Bektaş, 2010). Ranging from large-scale regional parks to urban parks, neighborhood parks, and even theme parks, they serve different scales of urban life (Bektaş, 2010).

Theme parks, sprawling across extensive areas, can be described as entertainment centers that encompass both indoor and outdoor spaces, offering a wide range of activities and attractions. While the concept of theme parks has roots in Medieval Europe, today's theme parks are notably advanced and diverse. These parks make substantial contributions to the development of cities and countries by providing entertainment, cultural enrichment, and educational experiences to their visitors. They break the routine of urban life, enabling individuals to immerse themselves in fantasy and adventures. By blurring the line between reality and imagination, theme parks offer unforgettable experiences to city residents (Baran and Kont, 2014; Asensio, 2000; Deniz, 2002; Topaloğlu, 2007).

These spaces, which enhance the cultural and entertainment aspects of cities, contribute to the identity formation of urban areas and the overall quality of life, have become indispensable elements of modern cities. Theme parks provide visitors with opportunities for both entertainment and learning. Particularly, children can acquire new concepts and information through these activities. Moreover, theme parks frequently serve as significant tourist attractions, making substantial contributions to the local economy (Gök and Bingöl, 2017).

1.1. Classification of Theme Parks:

Deniz (2002) classified theme parks as follows;

1. **Educational Theme Parks and Gardens:** This is the most common type of park among theme parks. Educational theme parks and gardens offer amenities such as libraries, laboratories, herbariums, exhibition areas, and educational activities to fully embrace the principles of education and research. An example of this type is the Prof. Dr. Aziz Sancar Mathematics and Science Park in Aydın Province.

2. **Climate-themed Parks and Gardens:** These are enclosed areas that allow visitors to experience climates that are uncommon for the region due to methods like artificial heating, cooling, and climate control, providing conditions not typically found in their location. An example is the Cebra Ski Resort in Denmark.

3. **History-themed Parks and Gardens:** These parks, found within theme parks, offer diverse activities by portraying the culture, history, traditions, architecture, beliefs, and lifestyles of

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

different civilizations. They are usually established in regions associated with the civilizations they represent. The goal of history-themed parks and gardens is to immerse visitors in the feeling of living in that historical period. An example is Euro Park in England (Gök and Bingöl, 2017).

 (Anonymous, 2012)

Euro Park England
 (Anonymous, 2023a)

Figure 1. Examples of parks and gardens with the themes of “Education”, “Climate” and “History”

4. Geography-themed Parks and Gardens: These parks aim to promote learning about the region and geography in which they are located, defining places and analyzing geographical events. An example of this theme is the Sultan Gazi Earthquake Education Park in Istanbul.

5. Recreation and Entertainment-themed Parks and Gardens: These areas are integrated into the urban structure, blending with nature and the surrounding landscape to create spaces where fantasy and entertainment converge. They feature various mechanical designs for entertainment and typically offer a combination of thrilling activities that challenge the imagination. Disneyland in France serves as an exemplary illustration of this theme.

6. Story, Fairy Tale, and Mythology-themed Parks and Gardens: These parks immerse visitors in the world of popular story, fairy tale, and mythology cartoon characters from both the past and present. They are adorned with a variety of cartoon-inspired architectural elements. An example of this theme can be found in Söke Wonderland, located in Aydın-Söke.

September 14-15, 2023, Naples, Italy

7. Art-themed Parks: These theme parks and gardens exhibit artistic products both from the region and various other places. An example can be found at Miniaturk in Istanbul.

8. Hobby-themed Parks: These parks and gardens offer people the opportunity to engage in various hobbies with access to materials and spatial structures, especially for those who may not have the chance to pursue their hobbies in their daily living environments. Their popularity has recently been on the rise. An example is the Hobby Garden in Denizli.

9. Natural Life-themed Gardens: These are places where the endemic species and fauna diversity of the region are showcased. This type of theme park is established with the goal of raising awareness about and conserving endemic species. An example is the Izmir Sasalı Natural Life Garden.

10. Specially Expressive Gardens: These are reserved thematic areas within neighborhood, city, and district parks, designed on both large and small scales. Examples include rock gardens, dry stone gardens, and areas designed with special explanations for disabled individuals.

11. Age-themed Parks: These parks focus on the past and future, highlighting the past's influence on the present. They also play a role in preserving historical environments. An example of such a park is Ankapark in Ankara.

2. MATERIALS and METHODS

2.1. Working Area:

In this study, we focus on Aydın province, which is situated in the Aegean Region of Turkey. Aydın province shares its borders with the neighboring provinces of Izmir, Manisa, Denizli, Muğla, and the Aegean Sea. As of 2022, Aydın has a population of 134,031, making it the third-largest province in the Aegean Region. The total land area of the province covers 8,117 km², with an average population density of 140 people per km². According to the 2022 data from the Turkish Statistical Institute (TUK), Aydın comprises 17 districts and municipalities, encompassing a total of 671 neighborhoods (Anonymous, 2022).

Aydın boasts a Mediterranean climate characterized by hot and dry summers, contrasted by mild and rainy winters. These climatic conditions, in conjunction with the region's topography, have given rise to two distinct plant communities: maquis and forest. In certain areas, the maquis vegetation starts right behind the coastal areas and extends to elevations of 500-600 meters. Particularly prevalent on the south-facing slopes and valleys, maquis communities gradually transition into forests at higher altitudes. These forests emerge at elevations of 500-600 meters on the mountainsides in both the north and south of the province. They consist predominantly of broad-leaved trees, primarily oak trees at lower elevations, and coniferous species such as red pine and larch trees at higher altitudes. Additionally, stone pines can be found in the Beşparmak and Madranbaba Mountains (Aydın Chamber of Commerce, Aydın Fig Sector Needs Analysis Report, 2016).

Aydın has a rich history marked by the presence of various ancient civilizations. Some of its prominent cities include Aphrodisias, Miletus, Didyma, Nysa, Priene, and Magnesia. The region's development can be traced back to around 2500 BC when the City of Tralleis was established during the Hittite period. Aydın flourished during the 8th century under the rule of Lydia and has been enriched with cultural assets and contributions from Turkish civilizations, including the Seljuk Dynasty. During the rule of Aydınoğulları, the city was known as Aydın Güzelhisar and was later renamed Aydın. In 1811, it became the provincial center, encompassing the sanjaks of Izmir, Saruhan (Manisa), Menteşe (Muğla), Antalya, and Isparta. After the War of Independence, Aydın became an independent province in 1923 (Anonymous, 2022).

Aydın province is renowned for its agricultural and tourism sectors. With a strong focus on agricultural product processing, approximately 55% of the population in Aydın derives their livelihood from the agricultural sector. Aydın leads the country in fig and chestnut production, ranking second in olive, cotton, artichoke, strawberry, and peanut production. Additionally, the province boasts a 150-kilometer-long coastline, making tourism its second major source of income.

Kuşadası and Didim are the primary tourist districts. The province is home to nine museums and 23 significant historical sites, both under the supervision of the Ministry of Culture and Tourism and privately managed.

Some of the notable archaeological sites in the province include Afrodisias (Karacasu), Alabanda (Çine), Alinda (Karpuzlu), Temple of Apollo (Didim), Gerga (Çine), Harpasa (Nazilli), Magnesia (Germencik-Ortaklar), Mastaura (Nazilli), Milet (Didim), Nysa (Sultanhisar), Priene (Söke), and Tralleis (Aydın-Efeler) (Anonymous, 2023).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

2.2.Methods:

The research primarily utilizes the Delphi Technique, a well-known method for decision-making and consensus-building. Alongside this approach, a comprehensive survey comprising both closed and open-ended questions was concurrently administered to experts. Survey data were subsequently analyzed using the Microsoft Excel program. Aydın stands out as a region renowned for its natural and cultural landscape potential. This region encompasses a diverse array of distinctive features that span various domains of expertise. To identify suitable themes for Aydın, it was imperative to solicit the consensus of experts and individuals well-versed in every facet of Aydın. Consequently, the Delphi Technique was employed as a systematic means to systematically gather insights and opinions from these experts to facilitate decision-making.

The following steps were undertaken in the research methodology:

I. Literature Review on the Subject: A comprehensive database was established by gathering up-to-date information on theme parks, the Delphi Technique, and Aydın province.

II. Selection of Panel Members (Participants): The study involved 22 panel members, encompassing landscape architects, agricultural engineers, city regional planners, architects, archaeologists, and local government representatives.

II. Development of the General Survey and the 1st Delphi Survey, and Distribution to Experts: The general survey included 19 closed-ended and 8 open-ended questions, focusing on assessing the experts' demographic profiles and their foundational knowledge regarding the subject. In the Delphi survey, experts were tasked with selecting the top 3 themes they considered suitable for Aydın City from a list of 11 thematic park categories. These surveys were administered to the panelists through face-to-face interactions.

IV. Development of the 2nd Delphi Survey and Distribution to Experts: The top 5 themes that garnered the highest votes in the 1st round were presented once more to the experts in the second round. They were asked to choose the three most fitting themes for the City of Aydın.

V. Evaluation of the Results: The analysis findings were merged with Aydın's natural and cultural landscape elements. Subsequent assessments were conducted, leading to the formulation of recommendations

3. FINDINGS and DISCUSSION

3.1. Findings From General Surveys

The Delphi Survey was conducted with 22 individuals who are experts in urban planning and design. This team consists of 7 landscape architects, 2 architects, 5 agricultural engineers, 4 city regional planners, 2 archaeologists, and 2 local government representatives. Among this expert group, 54.6% were women, and 45.4% were men. In terms of age distribution, 45% of the experts were in the 41-50 age group, 22% were in the 31-40 age group, 13% were in the 20-25 age group, 13% were in the 51-60 age group, and 4% were in the 26-30 age group.

Experts responded to the first question of the survey, which asked, "What do you think are the differences between theme parks and neighborhood, district, and city parks?" Their answers were analyzed, and it was concluded that the majority of experts (70%) are knowledgeable about the distinguishing features of theme parks compared to neighborhood and city parks.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

The second question posed to the experts was, "Which theme parks do you know, see, or hear about?" Experts provided examples of well-known theme parks, with Disneyland (36.36%), Vialand (13.64%), Miniaturk (13.64%), Legoland (9.09%), Viasea (4.55%), and Sazova Science Culture and Art Park (22%) being highlighted as prominent theme park brands.

The third question asked the experts to share their opinions on "Which theme park they think is suitable for the city of Aydın, among the parks they are familiar with." Among their responses, theme parks such as Disneyland (36.36%), LegoLand (9.09%), and Sazova Science Culture and Art Park (54.55%) were mentioned.

The fourth question is, "Is a theme park a commercial or public space?" It addresses whether theme parks are commercial or public spaces. The majority of experts (95%) stated that theme parks are currently planned with a commercial focus, but they pointed out that they should be public spaces.

The fifth question is, "Who should manage a theme park?" It includes a question about the management of theme parks. The majority of experts (90%) emphasized that the management of theme parks should belong to the public.

The sixth question is, "Should there be brand-name facilities and venues within the boundaries of the theme park that will compete with the theme of the park?" It addresses whether branded facilities should be part of the theme park. The majority of experts (75%) stated that branded facilities and venues should be included in the theme park but should not overshadow the main theme of the park.

The seventh question is, "Which of the parks in Aydın do you think has thematic features?" It asks experts to identify parks with thematic features. Experts mentioned parks such as Adaland (26.32%), Prof. Dr. Aziz Sancar Mathematics and Science Park (63.16%), and Wonderland Park (10.53%) as examples of parks with thematic features.

In the eighth question, the experts were asked to describe their dream theme park for Aydın with the belief that it would come true. They expressed their opinions, and based on their answers, it was determined that their dream parks mostly consist of Recreation and Entertainment Themed parks (33.33%), where all age groups can spend time together and have fun. Natural Life Themed Gardens (19.05%), where people can connect with nature, Art Themed Parks (9.52%), featuring miniatures of symbols reflecting the historical culture of the city of Aydın, Story, Fairy Tale, and Mythology Themed Parks with models of fairy tale heroes. There were also Parks and Gardens (9.52%) with elements showing the historical development of the city of Aydın, and finally, Entertainment Theme Parks (19.05%), where they prioritize the inclusion of film and TV series elements.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Table 1. “Describe your dream theme park for Aydın, with the belief that the park of your dreams will come true?” Themes represented by the answers to the question

Theme	Percentage rate (%)
Recreation and Entertainment	33,33
Naturel life	19,05
Art	9,52
Story, Fairy Tale, Mythology	9,52
History	9,52
Entertainment	19,05

In the surveys, social, economic, security, recreation, ecological, aesthetic and functionality dimensions were asked to be evaluated in the design of theme parks. The opinions of experts on these issues are presented in Table 2.

Table 2. Expert opinions on social, economic, security, recreation, plant selection, aesthetics and functionality dimensions in the design of theme parks

	Question	Yes (%)	No (%)	No Idea (%)
Social	<u>A theme park in Aydın should serve all age groups.</u>	86,40	13,60	0
	<u>In a theme park in Aydın, activity areas should be divided according to age groups.</u>	77,20	22,80	0
	<u>A theme park in Aydın should serve different users in terms of education level.</u>	54,60	31,80	13,60
	<u>There should be indoor social areas in a theme park in Aydın.</u>	81,80	18,20	0
Economic	<u>Entrance to a theme park in Aydın must be paid.</u>	45,40	50,00	4,60
	<u>A certain percentage of the entrance fees received from a theme park in Aydın should be used within the scope of the social responsibility project.</u>	64,00	27,20	9,20
	<u>Entrance fees from a theme park in Aydın should only be used for the benefit of that park.</u>	59,00	31,80	9,20
Security	<u>Every user of a theme park in Aydın should be able to use it around the clock.</u>	45,40	50,00	4,60
	<u>In a theme park in Aydın, all kinds of security measures should be taken in terms of park management.</u>	100	0	0
Recreation	<u>A theme park in Aydın should only allow for active recreation.</u>	9,20	86,60	9,20
	<u>A theme park in Aydın should only allow for passive recreation.</u>	4,60	77,20	18,20

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Plant Selection	<u>A theme park in Aydin should allow for both active and passive recreation.</u>	90,80	0	9,20
	<u>Endemic plants should be used in a theme park in Aydin.</u>	90,80	4,60	4,60
	<u>Exotic plants should be used in a theme park in Aydin</u>	72,80	13,60	13,60
Aesthetics and functionality	<u>The reinforcement elements used in a theme park in Aydin should be different from the usual classical reinforcements.</u>	90,80	9,20	0
	<u>A theme park in Aydin should have plastic elements suitable for the theme of the park.</u>	63,60	36,40	0
	<u>In a theme park in Aydin, completely natural aesthetics should predominate.</u>	63,60	27,20	9,20

According to Table 2, the majority of experts agree that a theme park designed in Aydin should have social benefits. They advocate that it should cater to all age groups (86.4%) and that the activity areas in the park should be divided based on age groups (77.2%). More than half of the participants (54.6%) believe that a theme park in Aydin should serve users with varying education levels, and the majority (86.8%) insist that there should be indoor social areas within the theme park.

When it comes to the economic aspect of a theme park in Aydin, the experts' opinions vary. They do not fully agree on the issue of imposing entrance fees to the park. According to the results, 50% of the experts argue that there should be no entrance fee, while 45.40% disagree. However, the majority of experts believe that a certain percentage of the entrance fees should be allocated to social responsibility projects (63.6%) and that the entrance fees should be utilized solely for the benefit of the park (59%).

Regarding the security aspects of designing a theme park in Aydin, experts hold differing views. There is no consensus on whether the theme park should be open 24/7, as 50% of the experts believe it does not need to operate round the clock, with 4.60% abstaining. Nonetheless, all experts unanimously agree that comprehensive security measures should be implemented concerning park management.

As a result of the experts' evaluations regarding the design of a theme park to be constructed in Aydin with a focus on recreation, the majority of experts agreed that a theme park should not be limited to just active recreation (88.6%) or passive recreation (77.2%). Instead, it was determined that they believe it should accommodate both active and passive recreation (90.8%).

In terms of plant selection for a theme park in Aydin, the experts' evaluations are as follows: the majority of experts emphasized the use of endemic plant species in the park (90.8%), along with the incorporation of exotic plant species (72.8%).

When it comes to the aesthetic and functional aspects of the design of a theme park in Aydin, experts provided the following insights: the majority expressed the need for equipment elements that differ from the typical classical equipment (90.8%), the inclusion of plastic elements in

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

harmony with the park's theme (63.6%), and a predominance of natural aesthetic elements throughout the park (63.6%).

3.2. Fundings From the Delphi Survey

In the 1st Round of the Delphi survey, experts were presented with 11 park themes and various theme parks, along with an "other" option, allowing them to add their own suggestions. They were then asked to select their top 3 choices.

The total number of participants for the options presented to the experts can be calculated as the "number of experts" multiplied by the "number of preferences." In this case, with 22 experts participating and each selecting 3 preferences, the total number of participants in the choices presented in the first round was $22 \times 3 = 66$. Since the evaluations are based on the number of choices made by participants, the frequency distribution in the first-round Delphi surveys includes 66 responses. The results obtained are provided in Table 3.

Table 3. Round I. Delphi survey evaluations

PARK THEMES	Participation	Distribution (%)
Art-themed Parks	12	18, 1
Natural Life-themed Gardens	12	18, 1
Recreation and Entertainment-themed Parks and Gardens	11	16, 6
Educational Theme Parks and Gardens	8	12, 1
Story, Fairy Tale, and Mythology-themed Parks and Gardens	6	9
History-themed Parks and Gardens	5	7, 5
Climate-themed Parks and Gardens	4	6, 0
Hobby-themed Parks	3	4, 5
Geography-themed Parks and Gardens	2	3, 3
Age-themed Parks:	2	3, 3
Other	1	1, 5
Specially Expressive Gardens	0	0
TOTAL	66	100

Among the park themes presented in the 1st Round, the five most preferred options were Art Theme Parks (18.1%), Natural Life Theme Parks and Gardens (18.1%), Recreation and Entertainment Theme Parks and Gardens (16.6%), Education Theme Parks and Gardens (12.1%), and Story, Fairy Tale, Mythology Theme Parks and Gardens (12.1%). To facilitate the formation of a consensus among the expert group, the top 5 most preferred park themes were presented once again in the 2nd Round, and the experts were asked to select their top 3 preferences. The preference results are detailed in Table 4.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Table 4. Round II. Delphi survey evaluations

PARK THEMES	Participation	Distribution (%)
Educational Theme Parks and Gardens	17	25, 7
Natural Life-themed Gardens	14	21, 3
Recreation and Entertainment-themed Parks and Gardens	14	21, 3
Art-themed Parks	11	16, 6
Story,Fairy Tale, and Mythology-themed Parks and Gardens	10	15, 1
TOTAL	66	100

When analyzing the 2nd Round Delphi survey conducted with experts, it was observed that the most favored park theme, with a 25.7% preference rate, was Education Theme Parks and Gardens. Following closely in the second and third positions were Natural Life Themed Gardens and Recreation and Entertainment Theme Parks and Gardens, both with a preference rate of 21.3%.

It's worth noting that Natural Life Themed Gardens, which were the top preference in the 1st Round, dropped to the second position in the 2nd Round. On the other hand, Education Theme Parks and Gardens, initially ranked fourth in preferences, became the most favored park theme in the second round. Meanwhile, Recreation and Entertainment Theme Parks and Gardens, which secured the third position in the first round, maintained its standing in the second round.

4.CONCLUSION and RECOMMENDATIONS

Theme parks exert a profoundly influential impact on a city, making their accurate selection a matter of utmost importance for the city's identity and tourism potential. The chosen theme must harmonize with the city's natural and cultural assets while fostering a positive impression among both tourists and locals. Moreover, the theme's potential to contribute to sustainability and conservation should be a consideration. Consequently, an interdisciplinary approach is essential when determining park themes, with a focus on reaching a consensus among experts. In doing so, the chosen theme stands a better chance of gaining acceptance and successful implementation by all stakeholders in the city.

To determine suitable theme parks for Aydın, a panel of 22 experts was assembled. The Delphi technique was employed to gather insights from this expert group, involving a two-round process. In the first round, experts were presented with 11 diverse theme park options and asked to select their top 3 choices. The results of the first round highlighted the 5 most favored theme parks, namely "Art-themed parks" and "Natural life-themed gardens," which each garnered 18.1% preference, followed by "Recreation and entertainment-themed parks and gardens" at 16.6%, and "Educational Theme Parks and Gardens" at 12%. "Story, fairy tale, mythology-themed parks and gardens" received 9% preference.

The second round prompted experts to choose 3 out of 5 theme parks, aiding in the determination of the most suitable options. As per these results, the most fitting theme parks

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

were identified as "Educational Theme Parks and Gardens" at 25.7%, "Natural life-themed gardens" at 21.3%, and "Recreation and entertainment-themed parks and gardens" at 21.3%.

Although "Education Theme Parks and Gardens" initially ranked fourth in the first round of the Delphi technique survey, it surged to the top spot in the second round. This shift in preference can be attributed to experts' prioritization of the conscious education of future generations. Furthermore, it is believed that educational theme parks can offer both enjoyable and instructive experiences.

While "Natural Life Theme Parks" shared the first place in the first round of the survey, they slipped to the second position in the second round. This change is likely due to the expert group's increased emphasis on the need for educational theme parks. Additionally, highlighting Aydın's endemic species and natural beauty played a significant role in the selection of this theme park.

The selection of "Recreation and Entertainment Theme Parks" is estimated to be motivated by the existing recreational and entertainment theme parks in Aydın province that are not functioning as expected. Additionally, these parks are seen as potential contributors to the economic development of the city.

In addition to these results, some of the following ideas and suggestions can be evaluated for the successful implementation of theme parks to be established in Aydın city:

When theme parks around the world and in Turkey are examined, it is seen that park design can be shaped according to the natural and cultural characteristics of the region. For this reason, it is of great importance that the theme park to be designed for Aydın is suitable for the natural and cultural riches of the region. Aydın's natural plants, rich historical and cultural heritage can be highlighted in the content of the theme park. Traditions, handicrafts and cuisine of the local people can be exhibited in the theme park, contributing to the local economy and providing a cultural experience. It may be possible to offer cultural and artistic content by creating museums and exhibition areas within the park. These spaces can support local artists and cultural heritage.

Educational Theme Parks and Gardens came to the fore in Aydın. These types of parks can provide fun learning opportunities for children and adults. Wildlife parks can likewise serve educational purposes and instill nature conservation and environmental awareness in visitors. In addition, this park can be designed within the framework of an understanding that respects Aydın's natural beauties and environmental values. Sustainability principles such as green energy use, water conservation, waste management and biodiversity conservation can be integrated into the design of the theme park. However, providing interactive experiences using technology can make visitors find the park more impressive. Smartphone applications, virtual reality experiences or thematic mobile guidance services may be considered.

In addition to these suggestions, the success of theme parks is closely dependent on the strategic decisions taken by local governments regarding park planning and design, implementation and sustainability. For this reason, local governments should conduct comprehensive market research to determine which target audience the parks appeal to and which age groups and interests they target. Demand analysis plays an important role in shaping the park's content and activities. Additionally, an effective marketing and promotion strategy should be developed before and after the opening of the park. Social media, websites, local events and media collaboration can be used for this purpose. Additionally, social responsibility projects can be

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

supported in the park, and projects such as environmental cleaning activities, educational programs or aid campaigns can increase the social impact of the park.

ABSTRACT

With the Industrial Revolution, the advancement of technology, and the increase in migration from rural to urban areas, cities have developed in an unplanned and infrastructure-deficient manner. This has led to an increase in concrete areas and a decrease in green spaces in cities. Consequently, this situation has resulted in the depletion of natural resources, disruptions to ecosystems, the exacerbation of global warming, and an increase in environmental pollution and chemical waste. To ensure the sustainability of limited natural resources, sustainability policies such as the use of environmentally friendly transportation systems, waste reduction, and the utilization of renewable energy sources have gained importance. Planning and designing university campuses in accordance with these policies will make significant contributions to using natural resources effectively and minimizing negative impacts on the environment. This study aims to explore the potential of the Amasya University Hakimiyet campus in the central district of Amasya to become a sustainable and green campus. In this direction, the concepts of sustainability and green campus were defined and the parameters required for the campus to be a sustainable and green campus (waste management, water management, green and sustainable transportation, green buildings, green areas and plant presence, energy management and green infrastructure) were examined through qualitative field observations. The status of the campus is evaluated, and recommendations are made to achieve ecological, social, and economic sustainability based on the findings.

Keywords: Sustainable Campus, Green campus, Amasya University Hâkimiyet Campus, Amasya.

1. INTRODUCTION

After the Industrial Revolution, with the development of technology and the increase in rural-to-urban migration, population growth and urbanization movements have occurred. As a result, cities have developed under unplanned and inadequate infrastructure conditions. Consequently, the rate of urbanization has increased, and the quantity of green areas (road trees, urban forests, campuses, agricultural areas, green areas, roofs, etc.) has been reduced due to factors such as housing construction and road construction, leading to an increase in urbanization. This situation has led to the deterioration of the ecosystems, an increase in global warming, the expansion of the ozone hole, and an increase in environmental pollution and chemical waste.

Due to the increasing consumption of natural resources over time and insufficient production, there has been a growing awareness that finite natural resources will eventually be depleted. As a result, serious efforts have been made in many parts of the world to find solutions for ensuring their sustainability and continuity. In this context, a policy of environmentally compatible sustainability has come to the forefront with the aim of establishing a healthy cycle in the natural-human-social system.

Sustainability means maintaining diversity and productivity and protecting people's ability to survive (Holmberg & Sandbrook, 1992). The concept of sustainability was accepted at the Stockholm Conference in 1972, which was the first global assessment in the field of environment, and the concept was first used officially in the Brundtland Report titled *Our Common Future* prepared by the United Nations Commission on World and Environmental Development (WCED) in 1987 (Kurt Konakoglu & Usta, 2019). In this report published by the United Nations in 1987, it is emphasized that to ensure sustainability, there should be a strong connection between ecological, social, and economic components, and growth among these components should be balanced and controlled. In this context, universities, which are places where scientific studies are carried out, contemporary approaches are developed and universal knowledge is produced, have important roles in ensuring sustainability. This role, which started with environmental education in universities, was shaped by the Talloires Declaration after the declaration held in France in 1990 (Ak, 2022). At the same time, in the new urbanization concept, important steps such as reducing waste consumption, utilizing renewable energy sources, and adopting motorless transportation systems are necessary to ensure the sustainable development of cities (Kurt Konakoglu & Usta, 2019).

Throughout history, universities have provided education in various fields and locations. Over time, changes have occurred within universities because of the socio-cultural differences in society and evolving societal needs. Consequently, in line with the needs, a single structure in which education was provided at universities was replaced by campus models formed by many structural mechanisms (Özipek, 2018). The concept of campus is defined as a multifunctional educational area where university education buildings, student dormitories, faculty members' residences and social facilities, walking paths outside these structures, streets, green areas, inner courtyards, and squares are located (Ayvaci, 2009). According to Hasol (1998), the concept of campus is defined as large areas where university education buildings, student dormitories, faculty housing, sports and social facilities are located together. It is thought that campuses, which contain the characteristics of cities, can be areas where the concept of sustainability can be easily applied, as they are places that can develop rapidly and easily adapt to globalization and technological developments (Kurdoglu & Çelik, 2016; Bayramoglu & Kurdoglu, 2018; Gömeli, 2018; Kurdoglu et al., 2018a; Kurdoglu et al., 2018b; Kurdoglu et al., 2018c; Kurdoglu et al., 2018d). At the same time, campuses that provide housing, work, leisure, and transportation functions promote the efficient use of energy and water conservation, utilization of rainwater, renewable energy usage along with green buildings, and the enhancement of environmental quality and green network structure. This leads to gains in ecological, social, and economic aspects. (Güllü et al., 2012; Kurt Konakoglu & Usta, 2019).

With the implementation of necessary planning and design approaches within the scope of sustainable development on university campuses, new university models have emerged, and universities have started to be referred to as 'eco-friendly universities,' 'sustainable universities,'

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

'eco-campus,' 'green campus,' 'environmentally friendly campus,' 'sustainable campus,' 'smart campus,' 'eco-conscious campus,' and 'climate-sensitive campus' (Ak, 2022).

Sustainable campuses are places where actions required to preserve the integrity of natural systems are carried out under an institutional identity. They also serve as living laboratories where a wide range of activities related to energy, transportation, education, food, water, innovative and environmentally friendly technology production, and more are implemented and demonstrated (URL-1, 2021). Green campuses, on the other hand, are defined as places where adverse environmental impacts are minimized, public awareness of sustainability is created, and the teaching and research functions of higher education institutions are fulfilled (Dahle & Neumayer, 2001). Sustainable and green campuses are an approach where a university's activities are ecologically sound, socially, and culturally equitable, and economically feasible (UNEP, 2013).

In the Sustainable Campus Declaration (ISCN-GULF), published in cooperation between the International Sustainable Campus Network (ISCN) and the Global University Leaders Forum organized by the World Economic Forum, three fundamental principles of the sustainable and green campus approach, which are holistically inclusive and hierarchical (sustainability of buildings), impacts, campus-wide planning and goal setting, integration of research-teaching and outreach) were determined (Global University Leaders Forum & International Sustainable Campus Network, 2010). In the Greening Universities Toolkit prepared for sustainable and green campuses, the necessity for universities to be ecologically, sociologically, and economically sustainable is emphasized (UNEP, 2013).

The planning and design of sustainable and green campuses are possible through the management of a comprehensive and long-term process. In this process, establishing planning principles for sustainable and green campus areas is achievable by identifying the problem and addressing it within the framework of infrastructure, management, and operations (Özdal Oktay et al., 2015). Velazquez et al. (2006), Alshuwaikhat et al. (2008), Ağı Günerhan et al. (2016) created a model proposal that can be used in sustainable and green campus planning and design processes. The approach of supporting ecological processes in the planning and design of sustainable and green campuses involves utilizing green infrastructure practices/approaches, which include landscape ecology principles and planning and design methods (Ak, 2022). In order to establish green infrastructure in sustainable and green campuses, it is necessary to utilize rainwater and wastewater, incorporate renewable energy-focused designs that enhance energy efficiency into campus planning, and use plant species that are suitable for climate and soil conditions. This way, a comprehensive sustainable approach can be achieved. (Güllü et al., 2012; Büyükkurt, 2019).

The Green Measurement (UI GreenMetric) System was developed by the University of Indonesia in 2010 to evaluate sustainability activities on campuses and encourage universities towards sustainability (UI GreenMetric Kılavuzu, 2017). UI GreenMetric system is a self-assessment tool that reveals the status of universities regarding sustainability and green campuses. This tool contributes to education and academia in universities on sustainable and green campus practices (Akpulat, 2019). UI GreenMetric system is an environmental sustainability model that generally consists of environmental, economic, and social parameters. The environmental aspect includes the use of natural resources, environmental management

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

and pollution prevention, the economic aspect includes profit and cost, and the social aspect includes education, society, and social participation (UI GreenMetric Kılavuzu, 2018).

Velazquez et al. (2006), Alshuwaikhat et al. (2008), Ağı Günerhan et al. (2016) and the UI GreenMetric System, sustainable and green campus parameters are: waste management, water management, green and sustainable transportation, green buildings, green areas and plant presence, energy management and green infrastructure. *Waste Management*: Universities that produce a significant amount of recyclable waste, especially paper, plastic, electronics, and metals, generate waste materials based on consumption. However, it is possible to contribute these waste materials back to the economy through recycling. Therefore, universities can not only create an economic resource for themselves through recycling activities but also assume an encouraging role by sharing an exemplary practice with other public and private institutions (Sahin et al., 2016). *Water Management*: Green infrastructure systems have gained particular importance in recent times, especially in the context of contemporary planning and design principles focusing on water management and conservation. In this regard, both the evaluation of landscapes and the provision of sustainable benefits from landscapes have become significant. Within urban infrastructure systems, the presence of landscaping is integrated to slow down, direct, and functionalize the excess water accumulated on impermeable surfaces in urban areas before it enters surface runoff. In this context, green infrastructure practices that can be used for rainwater management on university campuses can be listed as rain gardens, rain trenches, artificial wetlands, and green roofs (Büyükkurt, 2019).

Green and Sustainable Transportation: Transportation systems, while providing socio-economic benefits to societies, also bring various negative impacts in social and environmental terms. In traditional transportation systems, non-recyclable fuels are heavily used, the balance of benefits and costs is unevenly distributed, those without vehicle ownership bear many costs without reaping benefits, and transportation becomes an economic burden on governments, businesses, and households. Additionally, factors such as traffic congestion and irregular land use have led to an increasingly inefficient transportation system, resulting in adverse consequences for the environment and quality of life. In this context, the pursuit of balancing the benefits of transportation with its negative effects has given rise to the concept of 'sustainable transportation' (Cirit, 2014). In recent years, the bicycle has become an indispensable element in sustainable transportation due to the increasing energy consumption resulting from the intensification of private vehicle usage, which is both energy-efficient and cost-effective, for addressing environmental issues (Cengiz et al., 2016).

Green Buildings: Buildings are significant components of sustainable development due to their ecological, economic, and sociological impacts. In this context, green buildings that assist settlements in developing sustainably can be defined as elements (Dogan et al., 2018). Sustainable and green university campuses are areas where many structures are integrated with each other. Considering the development of environmentally friendly policies, high energy efficiency in energy consumption, and waste reduction within these areas, green buildings are considered important components of a green campus (Ak, 2022). *Green Areas and Plant Existence*: A campus's character is determined by the architectural structures, green spaces, and their relationships and coherence with each other on the campus. Campus green spaces play an important role in balancing the relationship between users and nature and improving campus living conditions. In this sense, in the sustainable green campus approach, the quantity and quality of green spaces a university campus possesses are considered important indicators of

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

the university's sustainable development. In this context, in sustainable university campuses, planning and design efforts that provide suitable campus living spaces for users' psychological and physical needs and ecological benefits become significant (Gül & Küçük, 2001).

Energy Management: Obtaining energy from limited fossil resources in nature leads to negative impacts on ecosystems and human health, causing irreversible harm. Therefore, the importance of energy conservation, the use of renewable energy sources, and energy efficiency and management has emerged to reduce the adverse effects of energy consumption on ecosystems and human health (Usma et al., 2019). Campuses, barracks, residential areas, or complexes with many buildings, such as university campuses, are high-energy-consuming areas. Such campuses, depending on their potential, are areas that require energy efficiency and energy conservation as they generate high carbon dioxide emissions in direct proportion to their energy consumption and costs (Sögüt et al., 2015). *Green Infrastructure:* Green infrastructure is a system approach that connects fragmented natural and cultural landscape areas within the urban concept, creating an open-green network system and establishing a balance between the natural and cultural fabric within the urban concept (Tokmak, 2021). From a functional perspective, green infrastructure systems provide solutions that support ecosystems, encourage sustainability with ecological, sociological, and economic benefits, and offer conservation and recovery. In this sense, the goal of the green infrastructure approach is to support, protect, and enhance ecosystems and biodiversity (Kaylı & Günes Gölbe, 2020). Rain gardens, permeable pavement coverings, vegetated swales, green roofs, and infiltration tanks are all part of green infrastructure applications (Torres, 2010; Jaber et al., 2012; Sert, 2013; Tikansak, 2014; Müftüoğlu & Perçin, 2015; Demirkır, 2019). This study aims to examine the potential of the Amasya University Hâkimiyet campus, located in the central district of Amasya province, to become a sustainable and green campus. In this context, the concepts of sustainability and green campus are defined, and the parameters required for the campus to become a sustainable and green campus (waste management, water management, green and sustainable transportation, green buildings, green spaces and plant diversity, energy management, and green infrastructure) are examined through qualitative land observations. The data obtained from the campus are analyzed, and recommendations are provided to achieve sustainability and green campus objectives.

2. MATERIALS and METHODS

In this study, the Amasya University Hâkimiyet Campus, located within the boundaries of the central district of Amasya province, was chosen as the study area. The Hâkimiyet Campus, selected as the study area, is situated on Muhsin Yazıcıoğlu Avenue. The campus consists of the Faculty of Education A-B-C Blocks, a conference hall, the central library building, the Rectorate building, and sports fields (Figure 1). It is located approximately 2.5 km from the city center of Amasya. It is within walking distance of the city center, and access to the city center by motor vehicle via Muhsin Yazıcıoğlu Avenue takes approximately 7 minutes.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Figure 1. Study area boundaries

In this study, information on the concepts of sustainability and the green campus was acquired, and a field study was conducted to determine the current state and infrastructure of the campus through qualitative land observations. The parameters required for the campus to become a sustainable and green campus (waste management, water management, green and sustainable transportation, green buildings, green spaces and plant diversity, energy management, and green infrastructure) were examined, and the data obtained from the campus were analyzed. As a result of these analyses, how transportation, energy resources, and waste management are provided within the campus, as well as which plant species and pavement materials are used on the campus, were elucidated. The results obtained from the previous steps were discussed, and the current state of the campus was evaluated, leading to the development of recommendations for ecological, social, and economic sustainability.

3. FINDINGS and DISCUSSION

Velazquez et al. (2006), Alshuwaikhat et al. (2008), Ag Günerhan et al. (2016) and sustainable and green campus parameters determined according to the UI GreenMetric System (waste management, water management, green and sustainable transportation, green buildings, green areas and plant presence, energy management and green infrastructure) at Amasya University. It was evaluated on the example of Hakimiyet Campus and the findings are as follows:

Amasya University Hakimiyet Campus includes academic buildings (Faculty of Education A-B-C Block), administrative buildings (Rectorate building) and socio-cultural buildings (conference hall, central library building) (Figure 2). The campus transportation infrastructure consists of vehicle and pedestrian roads. Car parks, which constitute an important element of the transportation system, are positioned parallel to the vehicle road. There is a large parking area near the Rectorate building and the library building. The floor covering of this area is concrete pavement, which is an impermeable floor. There are no bicycle paths within the campus. The campus has a slightly sloping land structure that is almost flat. In the study conducted by Kurt Konakoglu & Keskiner (2021), the lowest point of the campus is 392 m, which connects the Rectorate building to Hakimiyet Street, and the highest point is 420 m, which connects the Faculty of Education Block C and Muhsin Yazıcıoğlu Street. There are no waterways, water elements, rain gardens, or rain ditches within the campus. The campus green area system consists of the parts outside the campus buildings and transportation networks. In the study conducted by Kurt Konakoglu & Keskiner (2021), green areas in the campus are in the elevation range of 392-420 m (Figure 2). In terms of the topography of the campus, there is a 28 m height difference between the lowest and highest points. The Faculty of Education Block A-B-C, the conference hall, the library building, the Rectorate building and

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

the parking areas in the immediate surroundings of the building, the sports fields area, and the areas outside the motor vehicle roads and pedestrian paths constitute the green area of the campus. On the campus, there are grass areas and shrub groups between 392 and 400 m elevations, deciduous trees and shrubs, shrub and evergreen plant taxa between 400-410 m elevations and evergreen trees and shrubs between 410-420 m elevations. During the field studies, 30 different plant taxa, including 16 deciduous trees and shrubs, 8 evergreen trees and shrubs, and 6 shrubs, were identified in Amasya University Hakimiyet Campus (Table 1).

	<i>Nerium oleander</i>	Oleander	OLEACEAE
	<i>Rosa chinensis</i>	Chinese Rose	ROSACEAE

4. CONCLUSION and RECOMMENDATIONS

Universities have a sizable population consisting of students, and academic and administrative staff, along with structural elements such as green spaces, roads, buildings, and parking areas. University campuses, resembling small towns, are known to consume significant amounts of resources like energy and water, with high levels of carbon emissions, like a small city. This situation has direct or indirect negative effects on both humans and the environment. Given the adverse impact of university campuses on the environment and human health, it is of utmost importance for these campuses to be sustainable, not only to reduce their polluting factors but also to set an example and lead the community in pollution reduction efforts (Günerhan & Günerhan, 2016; Ak, 2022). Since sustainability is a long-term process, the primary goal in sustainable campuses is the rational use of natural resources, the second goal is ensuring long-term continuity, and the third goal is setting an example for the city in which they are located

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

(Büyükkurt, 2019). University campuses play a significant role in addressing the problems encountered in today's cities (Günerhan & Günerhan, 2016).

For a university to be considered sustainable, it must engage in sustainable activities, and these activities should be embraced by all campuses of the university. In this regard, it is important that all elements that make up the university, such as the structure of administrative and educational buildings on campus, transportation within the campus, campus landscaping, waste management, the use of plants on campuses, and the use of energy sources, are constructed in a manner that promotes sustainability.

On campuses, sustainability is achieved by using renewable energy sources for irrigation, heating, and hot water supply, collecting rainwater through drainage channels for watering plants on the campus, utilizing energy-efficient lighting fixtures, implementing green building and green roof practices, incorporating solar panels on building surfaces or rooftops, using permeable pavements on walkways and vehicle roads to facilitate rainwater absorption, promoting bicycle and pedestrian transportation to reduce the carbon footprint on the campus, reducing hard surfaces and increasing the number of green spaces with climate-appropriate plant species, and ensuring waste recycling (UC Davis, 2021).

In this study, Velazquez et al. (2006), Alshuwaikhat et al. (2008), Ağı Günerhan et al. (2016) and the sustainable and green campus parameters (waste management, water management, green and sustainable transportation, green buildings, green areas and plant presence, energy management and green infrastructure) determined according to the UI GreenMetric System, Amasya It is seen that zero waste and recycling practices are supported at the University Hakimiyet Campus.

There are no waterways, water features (ponds, pools, wetland areas, etc.), rain gardens, rain ditches, vegetated swales, or wastewater recycling systems on the campus in terms of water management and green infrastructure. It is observed that there is no green and sustainable transportation system on the campus, and transportation within the campus relies on motor vehicles, resulting in high greenhouse gas emissions. Although bicycle usage is common in the city, it is not preferred by academic and administrative staff as well as students within the campus. Therefore, there is no bicycle infrastructure, bicycle lanes, or bicycle parking areas within the campus. The ground surfaces outside the green areas on the campus are covered with impermeable concrete. Despite its potential, there are no green buildings, green roofs, or green parking lot practices implemented on the campus. Of the total campus area of 53,129.79 m², 41,271.00 m² consists of hard surfaces, while 11,858.79 m² is green space. Within the green areas of the campus, 30 different plant taxa have been identified, including 16 deciduous trees and shrubs, 8 evergreen trees and shrubs, and 6 bushes. Many of these identified plants have low water requirements, which can lead to excessive water consumption on the campus, surpassing its actual needs. It is observed that evergreen trees and shrubs, as well as bush groups, are predominantly used around the campus boundaries, while large grassy areas are present in the vicinity of the Rectorate Building.

Based on the findings obtained from the analyses conducted in the study, the following recommended practices can be implemented for Amasya University Hâkimiyet Campus to become a sustainable and green campus:

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

- A 'Sustainability Office' should be established on the campus to carry out sustainability-related initiatives.
- Rainwater should be collected in rain gardens or retention basins and treated for use in watering plants to minimize water consumption on the campus.
- Existing impervious surfaces in parking lots, ceremonial areas, and vehicle and pedestrian pathways should be replaced with permeable pavement to facilitate rainwater absorption.
- Green roof applications should be integrated into campus buildings and landscapes to reduce the urban heat island effect.
- Solar panels can be installed on the Rectorate Building, an administrative building within the campus, which receives ample sunlight compared to other buildings, and green building practices can be implemented.
- Perennial ground cover plants that are suitable for the Amasya climate, resistant to cold in winter, and capable of withstanding sun exposure in summer with low water requirements should be preferred for the open green spaces on the campus and areas near the buildings.
- To raise awareness among students about sustainability, courses related to sustainability can be added to the curriculum of each department, and student clubs can be established.

The results obtained from the study indicate that Amasya University Hakimiyet Campus lacks waste management, water management, green and sustainable transportation, green buildings, energy management, and green infrastructure according to sustainable and green campus parameters. It is believed that when these measures are successfully implemented, Amasya University could potentially be included in the Green Metric list.

ABSTRACT

How a street is viewed and perceived is determined by the user as well as the surrounding structures and the relationship of these structures to the street. The quality of a building is affected by the mass relationship or transition between the street and the building. In the analysis of the building-street relationship, dimensions and masses of the buildings, elevations of the entrance doors to the street, building distances from the parcel contour, facades, usage of the ground floor and the condition of the building blocks relative to each other are considered. Building-street relationship concept is a parameter that should be included in the urban design and building design processes and evaluated with an inter-scale perspective. This study was developed within the scope of the "Keep the Beşiktaş District Alive" project carried out with Beşiktaş Municipality. The concept of building street relationships in the study is analyzed in Beşiktaş Çarşı, Arnavutköy and Bebek. The study consists of concept analysis, current situation analysis and recommendations. In the concept analysis, building-street relationship; in the current situation analysis, the field investigations and complaints obtained as a result of face-to-face interviews with the residents of Beşiktaş Çarşı, Arnavutköy and Bebek districts; in the suggestions section, the suggestions of the author and residents of the neighborhoods and the solution suggestions produced in the workshop held with the architecture students are included. The study aims to determine and evaluate the problems of the neighborhoods examined in the Beşiktaş district, in the context of building-street relationships.

Keywords: Urban Design, Building-Street Relationship, Street Typology.

1. INTRODUCTION

Urban morphology, which has an important place in research conducted within the scope of urban studies, is a branch of science that examines urban form. It examines the changes that the urban texture elements of the physical environment such as building blocks, street textures, and full-empty ratios have undergone in the formation and historical process within the scope of socio-spatial variables (Kubat, 2018). Carter, on the other hand, defines urban morphology as the examination of the internal structure of the city (Carter, 1983).

In his research, Kropf (2011) emphasized the orientation of urban morphology studies to understand, organize, transform, and manage the structure and complexity of the built environment. While it is not possible to observe some changes covering a large area in the formation process of the urban space, the changes occurring at the scale of a single parcel or building block can be observed concretely. These changes, which usually take place gradually, can be observed in the shape of the building block, parcel dimensions, structuring order, and

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

building heights (Ayan, 2010). The independent components that make up the urban morphology are expressed in Figure 1.

Figure 1. Urban morphology

The building block, which is one of the components of the urban morphology, consists of adjacent parcels with a circulation area around it and no streets passing through it. The building block appears as the basic form determinant. The building block layout is determined by the size and mass relations of the buildings, the location of the buildings relative to the street and their relations with the street, and the relations of the buildings with each other and with their gardens.

Within the scope of this study, which was developed within the scope of the "Keep the Besiktas Neighborhood Alive" project carried out with the Municipality of Beşiktaş, the relationship between the building island, street, parcel and building in the middle and lower scales was emphasized, and in this context, the concept of building-street relationship, which can be considered at the building island scale, was examined. The building-street relationship is discussed in Arnavutköy, Beşiktaş Çarşısı and Bebek Districts. The study consists of three parts: concept analysis, current situation analysis and recommendations. In the first part, the concept of building-street relations and the things examined within the scope of this concept are introduced. In the second part, Arnavutköy, Beşiktaş Çarşısı and Bebek districts are examined in the context of the building-street relationship, and the user opinions obtained within the scope of the "Keep Your Neighborhood Alive" project realized with Beşiktaş Municipality are also included. In the third part, suggestions were made as a result of the examinations. It is aimed to determine and evaluate the problems of the neighborhoods examined in the Beşiktaş district, in the context of building-street relationships, serving as a guide for the study.

The Concept of Building Street Relationship

A successful city has streets that people can relate to. How a street looks and feels is determined by the structures around it. The quality of a building is strongly influenced by the nature of the approach or transition between the street and the building (Auckland Council, 2022). The concept of the building-street relationship is examined at the scale of the building block, which is one of the components that make up the urban morphology. The building-street relationship is determined by the size and mass of the buildings, the elevations of the entrance doors relative to the street, their facades, their distance from the parcel outline, the use of the ground floor, and the situation of the building blocks relative to each other. By examining these features,

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

information can be obtained about the width of the streets, street typology, their efficient use, and access to natural light.

According to Van Nes and Yamu (2021), the first of the main factors of the building-street relationship is the spatial structure of the street network of the built environment, and the second is the micro-scale spatial relationship between private and public spaces. In urban studies, micro-scale spatial relationship concerns the interrelationship between buildings and street sections. It concerns how building openings are connected to the street network, that is, the degree of topological depth from private to public space and the mutual visibility between doors and windows on the streets. According to Jacobs (1960) and Gehl (1996), entrances and windows should face the street to ensure liveliness in the streets. The density of windows and entrances, which provide a direct connection between buildings and the street, is one of the factors that affect the degree of security in urban areas. The way entrances and windows are positioned on facades and their relationships with each other on both sides of the street affect the degree of social control, natural surveillance, perception of security, and street life (Van Nes and Yamu, 2020) (Figure 2).

Figure 2. Different types of facades (Van Nes & Yamu, 2021)

Adjacency and permeability levels of building facades are important in terms of having a positive building-street relationship (Hillier & Hanson 1984). If the entrance of a building can be directly accessed from the street, this constitutes a safe street. However, buildings with blind facades, buildings with only a few windows facing the street, or buildings with only entrances facing the street can be said to be negative in terms of the building-street relationship, as they create the perception of an unsafe street. This spatial relationship between private and public space has an impact on the vitality of street life in urban areas (Van Nes & López, 2010). But, since building entrances can be located at the same level as the street, at a lower level, or a higher level, depending on the project and the topography, during the design and implementation process, the possibility of entrance stairs creating intrusive action on the streets should be taken into account. Entrances to buildings, that is, private areas, may not be directly connected to streets. There are many semi-public or semi-private spaces between a private space and the public space represented by the street. Front gardens can be given as examples of these areas. If an entrance is directly connected to a public street, it has no semi-private or semi-public spaces between the private and the public spaces. This situation is explained by the concept of topological depth (Van Nes & Yamu, 2021) (Figure 3).

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

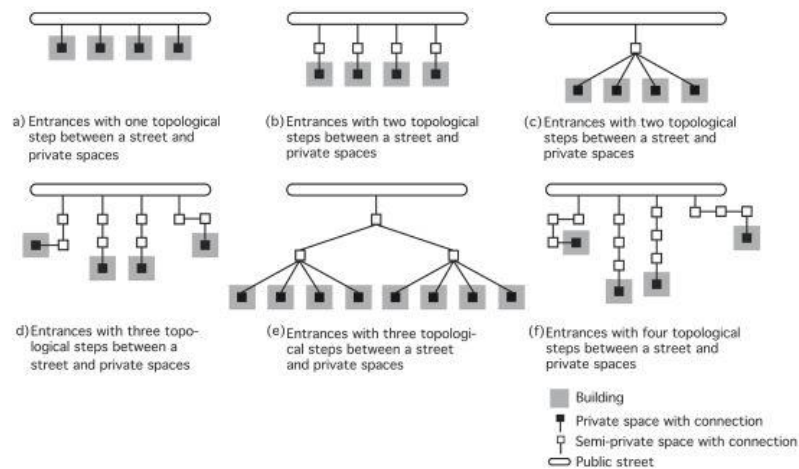

Figure 3. Various topological depths between private and public spaces (Van Nes & Yamu, 2021)

Apart from building facades, entrances, draw distances and gardens, different functions located on the ground floors are also examined in the context of the building-street relationship. According to Gehl (1936), a lively city gives a friendly and welcoming signal to its users along with social interaction. For this reason, it can be said that the presence of entertainment venues such as cafes and restaurants on the ground floors of the buildings interact with the streets and create lively public spaces. However, the different functions located on the ground floors may cause the area to turn into an area where people are not happy to be unless the environment is taken into account and designed accordingly. For this reason, buildings and streets should be considered together.

Examination of Arnavutköy, Bebek, and Beşiktaş Çarşısı Neighborhoods in the Context of Building-Street Relationship

Within the scope of the project, field trips were organized to Beşiktaş Çarşısı, Arnavutköy and Bebek regions. As a result of the field trips, the relationships of the buildings in the region with the street were examined and reported. After preliminary research, it was aimed to obtain direct opinions from the residents of the district. In the meetings held with the residents of the district on April 15, 2022, in Arnavutköy, on April 22, 2022, in Beşiktaş Center, and on June 2, 2022, in Bebek, solution tables were established and the problems experienced by the users regarding the district were discussed and records were kept. At the end of the interviews, surveys containing the criteria of the approach and principles created for this study were applied to the residents of the district, and data about the districts were collected in a certain systematic way. In this part of the study, the data obtained as a result of field trips and interviews with district residents are presented.

Examination of Arnavutköy Neighborhood in the Context of Building-Street Relationship

Arnavutköy is a neighborhood of Beşiktaş district, with Bebek in the north and Kuruçeşme in the south. The name of Arnavutköy District has changed many times from past to present. In ancient times, it was named "Hestai" because of the lime kilns on the hill. During the Roman period, when Consul Promotos settled here, it was first called "Promotu" and then "Anaplous". After the village accepted Christianity, Ayios Mikhailaion Church was established and the

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

name of the district was changed to "Mikhailaion". In the following years, it was called "Horasmoto" meaning "Village of Angels". There are various opinions among historians about where the current name of Arnavutköy comes from. According to some historians, the name of the district comes from the Janissaries of Albanian origin who were assigned to protect the district after Fatih Sultan Mehmet conquered Istanbul in 1453, and according to some historians, it was named after the janissaries of Albanian origin in the 19th century. It was named after the cobblestone masters brought by Sultan Abdülmecid in the 16th century. Although most of the buildings in Arnavutköy belong to the 20th century, some of them were built in the Art Nouveau style. Although there are reinforced concrete structures in the district today, the historical buildings are generally wooden houses (Figure 4, 5).

Figure 4- 5. Historical buildings of Arnavutköy neighborhood (Tekkol, 2021)

Arnavutköy neighborhood, together with Bebek, Kuruçeşme, and Ortaköy, constitutes the core of the Beşiktaş district. Although Beşiktaş district has undergone various urban transformations since the republican period until today, these transformations have largely led to the formation of settlements such as Levent, Zincirlikuyu, Nispetiye, and Etiler, and no large-scale changes have been made in the regions that form the core of the district (Çağlayan, 2020). In this way, it is possible to see the neighborhood order of the Ottoman period in the Arnavutköy neighborhood today. Due to the proximity of building blocks and parcels to each other in the region, narrow streets, which are characteristic of Ottoman neighborhoods, are observed (Figure 6).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 6. A historic map of Arnautköy (Kitantik)

In the study, the part shown on the map below for the Arnautköy neighborhood was examined, observations were made on this region and suggestions were given (Figure 7).

Figure 7. Studied area for Arnautköy Neighborhood (Snazzy maps)

Arnautköy neighborhood generally consists of historical buildings. These buildings have bay Windows (Figure 8). Bay windows, which are generally located on the second and third floors of buildings, protrude onto the streets, and this creates the perception of a safe street for users. However, it has also been observed that the buildings being adjacent to each other and their retreat distances create narrow streets causing the streets not to receive sufficient daylight.

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 8. Historical buildings of Arnavutköy

The front or back garden, which is generally found in traditional Turkish houses, does not exist in most of the buildings in Arnavutköy. Since the entrances of the buildings open directly to the street, their relationship with the street is direct (Figure 9). In other words, the building-street hierarchy dominates the neighborhood.

Figure 9. Entrances of the buildings opening directly to the street (Google Maps)

Depending on the topography of the area, as you move north, it is seen that the building entrances are higher than the street level and the entrances to the buildings are provided by stairs. Row houses, which were built in some parts of Istanbul in the past, are also located in the Arnavutköy neighborhood. There are examples in these houses where the ground floor is higher than the zero level. Therefore, in some streets in Arnavutköy, buildings whose entrances can be reached by stairs have been observed, not because of the topography of the region, but because the ground floors are located at higher elevations. These structures were found in Teyyareci Suphi Street and Arnavutköy Dere Street (Figure 10- 11).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 10. A building entrance in Teyyareci Suphi Street (Google Maps)

Figure 11. Building entrances in Arnavutköy Dere Street (Google Maps)

Buildings whose entrances are higher than the street level act intrusively on the sidewalks due to their stairs. Stairs extending from outside the building to the pavements interrupt pedestrian circulation. This situation causes the building's relationship with the street to be negative in the context of user movements. However, it does not hinder the directness of the building's relationship with the street. The fact that the building entrance stairs extend directly from the building to the street proves that the buildings and the streets are inseparable and should be considered together.

There are shops, cafes, and restaurants on the ground floors of the buildings located on Bebek-Arnavutköy Street and on Beyazgül Street, Dubaracı Street, and Sales Square Street, which are close to this street. These functions, which emphasize public use, perceptually strengthen the relationship of the buildings with the street by reinforcing the publicity of the streets for the users of the area. At the same time, it enables users to feel safe on the streets, which are public spaces, by providing activity on the streets (Figure 12, figure 13). However, the functions located on the ground floors intensify human circulation in the area, causing vehicle traffic to increase. This situation makes the relationship of the buildings with the street indirect and turns it into a structure-vehicle-street hierarchy.

Examination of Beşiktaş Çarşı Neighborhood in the Context of Building-Street Relationship

Beşiktaş Çarşı district, which is located in Beşiktaş district, is known as Sinanpaşa District. However, due to the region's place in urban memory, it is also known as Beşiktaş Bazaar among the public. The district is surrounded by Cihannüma, Türkali, and Vişnezade districts and the Bosphorus. Sinan Pasha Mosque, from which it takes its name, Barbaros Hayreddin Pasha Tomb and square, and Istanbul Maritime Museum are within the borders of this region. The neighborhood is located at the intersection of Barbaros Boulevard, Beşiktaş Street and Çırağan Street. The neighborhood can be reached by means of transportation such as ferries and buses.

Sinan Pasha, who was the captain of the Ottoman Navy between 1550 and 1553, gave his name to the neighborhood. Sinan Pasha Mosque, built by Mimar Sinan and located within the borders of the region, took its name from Captain Admiral Sinan Pasha. It is known that in the 17th century, Beşiktaş Park and its surroundings, where the Barbaros Monument is located, was a submerged bay. This bay was filled and turned into a private garden for the rest and entertainment of the sultans. Mansions and pavilions were built in this garden in various periods and the Beşiktaş district began to develop rapidly (Figure 14). From that period onwards, the name Beşiktaş; started to be used for the region including Sinanpaşa and its surrounding districts. Thus, the district formerly known as Beşiktaş is now known as Sinanpaşa district. As Beşiktaş continues its development along the coastline, Sinanpaşa district has also started to become a neighborhood. Today, it is the busiest and central region of Beşiktaş district.

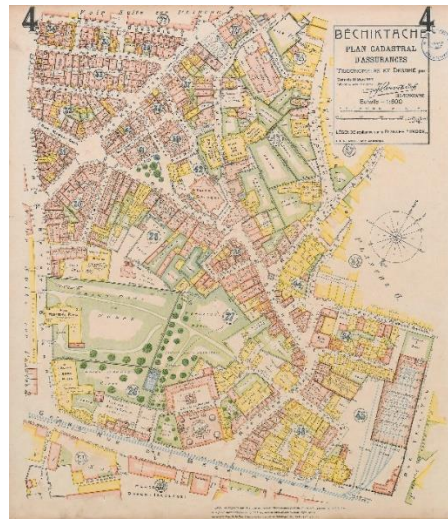

Figure 14. Pertvititch Map of Beşiktaş Çarşı (Sinanpaşa) (Salt Araştırma)

In the study, the part shown on the map below for the Beşiktaş Çarşı (Sinanpaşa) neighborhood was examined, observations were made on this region and suggestions were given (Figure 15).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 15. Studied area for Beşiktaş Çarşısı (Sinanpaşa) (Snazzy Maps)

Beşiktaş Çarşısı, also known as the Sinanpaşa neighborhood, which is the busiest area of the Beşiktaş district, has some differences from other regions examined in the study in terms of building-street relationships and building functions. The abundance of public transportation opportunities and its connecting nature with other neighborhoods have made the region the busiest neighborhood of the district. The density in the region has shaped the functions of the buildings. It has been observed that very few of the buildings here are used as residences. As a result, more shops were found on the ground floors of the buildings compared to the other neighborhoods examined in the study. The fact that building functions generally consist of shops, cafes, and restaurants is the determining factor in the relationship of buildings with the streets in the region. Although the different uses on the ground floors provide activity on the streets, tables, chairs and various store elements act intrusively on the streets by restricting pedestrian circulation (Figure 16, figure 17).

Figure 16- 17. Ground floor usage in the district (from the Author's Camera)

The intrusive action of buildings with commercial and entertainment functions on the streets negatively affects the building-street relationship in the context of user perception. In addition, buildings with different functions create vehicle density in the narrow streets that are currently formed due to the proximity of parcels and building blocks to each other and cut off the connection of the buildings with the street. This situation creates the structure-vehicle-street hierarchy and makes the relationship of the building with the street indirect. It has been observed that the gaps formed due to the difference in levels between the entrances of some

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

buildings in the Beşiktaş Bazaar area and the sidewalks disrupt the pavement axis and create difficulties for disabled individuals. Generally, the entrances of the buildings are higher than the level of the pedestrian walking area on the street, sidewalk, and bazaar, and they are reached by 3-4 steps of stairs (Figure 18). It was observed that the entrances of some buildings were below street level (Figure 19). To reach the entrances of these buildings, pavements were used and a gap was created, therefore the pavements lost their function. This situation interrupts the relations of the buildings with the street and pedestrian circulation.

Figure 18- 19. Buildings with Different entrance levels on Ressam Hamdi Bey Street (from the author's camera)

When the buildings in the region are examined, it is observed that almost all of them are adjacent. Some buildings have blind facades and high garden walls. If the transparency rate on the facades of adjacent buildings is not sufficient and the blind facades face the already narrow streets, they form an uninterrupted wall form on the streets (Figure 20, 21). These buildings cause the streets not to receive enough daylight due to the buildings, create a perception of insecurity for the users, and negatively affect the public nature of the streets. In this observed situation, it can be said that the surroundings of the buildings were not considered during the construction and design phase and the building-street interaction remained weak.

Figure 20. High garden wall and windowless facade on Selamlık Street (from the author's camera)

Figure 21. High garden wall on Abbasağa Cami Street (from the author's camera)

In the past, the buildings on the street were single-story and mostly two-story buildings built of wood and masonry. For this reason, they do not cause major problems in terms of building-

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

street relations in narrow streets. However, in the current situation, buildings built in reinforced concrete systems have very different dimensions such as 3 floors, 6 floors, and 8 floors (Figure 22). Although the excessive increase in gauge does not cause any discomfort in terms of its relationship with the wide Beşiktaş Street, as it does in narrow streets, the fact that the buildings do not have an order in terms of gauge, obstructing daylight in narrow streets, the formation of high, uninterrupted walls in the streets and the size-mass relationship reveals a problematic situation.

Figure 22. High-storey reinforced concrete buildings on the Beşiktaş Street (Google Maps)

Examination of Bebek Neighborhood in the Context of Building-Street Relationship

Bebek is a neighborhood of the Beşiktaş district, with Aşiyan neighborhood in the north and Arnavutköy neighborhood in the south. After the conquest, the janissary chief, Bölükbaşı Bebek Çelebi, who was responsible for ensuring public order during the construction of Rumeli Hisarı, had a mansion and garden built for himself in Bebek, the settlement next to Rumelihisarı, and it is known that after Çelebi's death, the settlement was called Bebek (Küçük, 2021). In the 16th and 17th centuries, settlement was encouraged in the Bosphorus, and a slow but regular population increase occurred over time. Although Turkish neighborhoods were established in some Bosphorus villages such as İstinye, Üsküdar, and Yeniköy in the 16th century, there are mostly Greek settlements in Bebek and the Turkish neighborhood in the district was established in the 18th century.

The district was opened to construction in this century and was equipped with various structures such as mosques and masjids. Following this, the land belonging to the state on the coast and on the land side, up to the Kayalar location on the Küçük Bebek side, was parceled out and sold to the public. Within a few months, a new Boğaz village/neighborhood was established here and this village was called Hümayun-âbâd. Besides, the name Bebek continued to be used (Koçu, 1961). This formation is parallel to the neighborhood establishment of the Ottoman period. Starting from the 1950s, as a result of the policies of the period, migration to Istanbul increased and squatter settlements began to appear. High-rise apartment buildings, vehicle scale and wide streets, which were the urban perception of Istanbul between 1950 and 1960, began to be accepted in Bebek over time. High-rise buildings built from reinforced concrete between 1960 and 1965 began to appear throughout the region. As of the beginning of the 21st century, construction activities continued (Küçük, 2021). In the study, the part shown on the map below for the Bebek neighborhood was examined, observations were made on this region and suggestions were given (Figure 23).

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 23. Studied area for Bebek Neighborhood (Snazzy Maps)

When the facades of the buildings in the Bebek neighborhood were examined in the context of their relationship with the street, buildings with wider and more transparent facades were found on Cevdet Paşa Street compared to the other two areas discussed in the study. In addition to having wide and highly transparent facades, these buildings have large front gardens, which ensures that users have a positive street perception, that the buildings establish a non-intrusive relationship with the streets, and that the streets receive sufficient daylight (Figure 24, figure 25). In addition to the presence of large buildings with high transparency in the region, buildings with blind facades, few windows, and low transparency were also seen, especially on narrow streets. These structures prevent sufficient daylight in the already narrow streets during the day, and at night, due to the lack of artificial lighting, they increase the perception of insecurity and cause the buildings to have a negative impact on the streets. Such structures were seen on Bebek Bostanı Street. (Figure 26).

Figure 24, 25. Buildings with wide facades on Cevdet Paşa Street (Google Maps)

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 26. Low transparency facades on Bebek Bostanı Street (from the author's camera)

Front and back gardens were more common in the Bebek neighborhood compared to the other two areas examined in the study. It has been observed that in some buildings whose entrance level is lower than the street level, the entrance stairs are prevented from interfering with the sidewalks and streets by using front gardens or intermediate spaces. In İnşirah Street and Bebek Yokuşu Street, it is generally seen that the building-street relationship is not direct, but there is a building-garden-street hierarchy (Figure 27, figure 28). In addition, supporting gardens with landscaping, dense green texture, and use of garden fences provide a spacious atmosphere for city residents passing by on the Street (Figure 29, 30).

Figure 27, 28. Building-garden-street hierarchy in Bebek (Yıldırım et.al., 2022)

Figure 29, 30. Building-front garden-street hierarchy on İnşirah Street (Google Maps)

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

However, it has been observed that the entrance stairs of some buildings that do not have a front garden and whose entrance levels are different from the street level act intrusively on the sidewalks and streets (Figure 31, 32). This situation cuts off pedestrian circulation and shows that the building-street relationship is not taken into account in the design and implementation process.

Figure 31, 32. Buildings whose entrance levels are different from the street level (from the author's camera)

In the area, it is seen that there are commercial and entertainment venues on the main street, that is, Cevdet Paşa Street, as in the Arnavutköy district, and on the ground floors of the buildings located close to this street. These functions create vehicle and pedestrian density in the region and cause sidewalk interference. However, since some of the businesses seen along Cevdet Paşa Street have private areas that do not occupy the sidewalks, there is no interference with the pedestrian axis of these businesses. This is proof that streets, which are urban elements, are taken into consideration in building design and the use of different functions located in the building.

Figure 33. A cafe that does not take intrusive action on the streets (Google Maps)

Opinions of Users of the Areas and Student Observations

Within the scope of the Beşiktaş Municipality "Keep Your Neighborhood Alive" study, interviews were held with the users of Arnavutköy, Beşiktaş Çarşı and Bebek neighborhoods on 15 April 2022, 22 April 2022 and 2 June 2022 (Figure 34, figure 35). The users who attended the meetings were generally residents of the neighborhood and tradesmen. However, a few local tourists also attended the meetings to express their opinions. As a result, ideas were obtained from different perspectives of different users. In the interviews, users expressed their complaints and requests specific to their regions. Approximately 50 people were interviewed in each region. User requests and needs were noted, and ideas were asked for solutions to the problems.

Figure 34, figure 35. Meetings with the users of Arnavutköy, Beşiktaş Çarşı and Bebek neighborhoods (from the author's camera)

According to the interviews, the complaints and requests of the users of Arnavutköy, Beşiktaş Çarşı and Bebek neighborhoods are given in the table below (Table 1).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Table 1. Complaints and requests of the users

District	Requests and Complaints
Arnavutköy	<p>"The sidewalks are occupied by shops. For this reason, it is difficult for people to cross the sidewalk."</p> <p>"Cafes should not occupy sidewalks. They should have their private areas and arrangements should be made for this."</p> <p>"We cannot use the streets. We do not want the cafe bar furniture in the streets."</p> <p>"No more businesses should be licensed."</p>
Beşiktaş Çarşı	<p>"We cannot go out because of the cars parked at our door. Our buildings have completely lost their connection with the street."</p> <p>"I am a tradesman, I comply with my occupation limits, but we are having problems with both the tradesmen and the public because other tradesmen exceed these limits and spill into the streets."</p> <p>"Cafe and bar functions do not fit historical buildings in the area."</p> <p>"Many tradesmen do not comply with the rule regarding the limit of the area where they can place their tables and chairs. This needs to be inspected and the limit of table and chair occupation on the sidewalks should be reduced by 50%."</p>
Bebek	<p>"The sidewalks reserved for pedestrians on İnşirah Street are insufficient. The streets need to be organized, the levels should be corrected and the slopes should be used effectively."</p> <p>"The valets in the cafe-bar establishments occupy the sidewalks in the side streets, we cannot walk on the already narrow pavement anymore because of these valets."</p> <p>"Although the shops on the ground floors provide activity in our area, they do not fit into our neighborhood."</p> <p>"I am a tradesman here. I comply with the street occupation limits. Cafes and restaurants have helped revitalize the streets and make Bebek one of the most popular areas of Istanbul."</p>

According to the interviews, almost all residents of the three regions complained about the different functions located on the ground floors, creating vehicle and human congestion and occupying the streets. In addition, the tradesmen did not complain about this situation but complained that other tradesmen placed their items such as tables and chairs in a larger area outside than they did. There appears to be a dilemma here. The ground floor functions of buildings, which is the most talked about topic in the context of the relationship of buildings with the street, are perceived differently by different users. While this situation is negative for the residents of the neighborhood, shopkeepers, and local and foreign tourists do not complain.

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

On the contrary, they think that these functions revitalize the regions, emphasize the publicity of the streets, and strengthen the relationships of the buildings with the streets.

In the Keep Beşiktaş Neighborhood Alive Workshop held between 8-22 May 2022, participating students, accompanied by workshop facilitators, made observations in Arnavutköy, Beşiktaş Çarşısı, and Bebek neighborhoods (Figure 36). By sharing the observation results with the managers, they developed solution suggestions and expressed them in the sheets. Student and author observations are similar.

Figure 36. Participating students and site observations (from the author's camera)

According to students, building entrances are decisive in the relationship of buildings with the street. It has been observed that some building entrances can be reached by stairs due to the level differences between the street and the building, but most of these stairs act intrusively on the streets. In all three regions, negative aspects of the functions located on the ground floors were encountered in terms of building-street relationships. It has been observed that tradesmen's courier vehicles and items such as tables and chairs occupy the sidewalks and streets. It has been stated that the gaps formed between the building and the street due to level differences cut off the relationship of the buildings with the street and pose a danger to pedestrians. Also, it has been observed that narrow streets were formed due to the proximity of building blocks and parcels to each other, but today, especially in the Beşiktaş market area, the street typology is in the form of buildings-narrow pavements-vehicles-narrow streets. Although front garden formation and building-front garden-street interaction are generally seen in the Bebek neighborhood, this formation is not seen in the Beşiktaş Çarşısı area and has been observed, rarely, in the Arnavutköy neighborhood. The analysis posters prepared by the students are shown below (Figure 37, Figure 38, Figure 39).

4.SUGGESTIONS and CONCLUSION

The building-street relationship is one of the important features examined within the scope of urban morphology to create livable cities. Within the scope of this concept, the relationships of building facades, entrances, ground floor functions and gardens with the streets in Arnavutköy, Beşiktaş Çarşısı and Bebek regions were examined. Apart from the author's observations, the data obtained as a result of the meeting held in all three regions on different dates and attended by the users of the region and the workshop organized for students were also taken into account.

Although ground floor functions are important for the creation of active streets, these functions cause some problems in all three regions because they are positioned without taking into account the structure of the streets, which are public spaces. In this context, a few suggestions will be given: The usage limit of businesses on the ground floors of buildings on pedestrian paths should be determined, it should be a maximum of 1.5 meters and it should be under supervision. In order to reduce the vehicle density currently caused by ground floor functions, parking should be built in the most suitable area without damaging the historical texture of the region, and vehicle density, especially in narrow streets, should be prevented.

Another problem observed in the context of building-street relationship in the areas is the building entrance stairs. It has been observed that the built environment is not taken into account sufficiently during the application phase of many entrance stairs or the construction of pavements, and the draw distance is not observed in relatively new buildings. These factors cause the intrusive action of entrance stairs on the streets. In order to solve this problem, sidewalks should be made wider (minimum 1 meter) to match the width of the street or the entrance doors of non-historic buildings should be moved back, space should be reserved for stairs outside the sidewalk, and obstruction to the pedestrian axis should be prevented.

In all three regions, it has been observed that some streets create an unsafe perception in people due to the blind facades of the buildings or insufficient transparency rates. However, as explained in the study, building facades are the most important factor in the building-street relationship. To address this problem, building facades (historic and non-listed) that give rise to continuous street walls must be appropriately disrupted by other architectural features,

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

including building articulation, setbacks, and potential protrusions in the building envelope. New buildings to be built in the regions should be designed in such a way that the facades and entrances of the buildings will create the perception of a safe, livable and strong public street in people, that is, taking into account the presence of windows and entrance doors on the adjacent streets.

Parcels and building blocks come together to define the streets. The buildings located on the plots make both typological and perceptual definitions of the streets. Although these private and public spaces are different in terms of space hierarchy, they always interact with each other. For this reason, streets should be taken as a reference when designing buildings, and buildings should be taken as a reference when creating streets. Otherwise, it is impossible to create lively buildings and streets for users.

ABSTRACT

Streets are micro-scale urban outdoor areas encompassing the ground, pedestrian walkways, and roadways and bounded by building facades. They serve as urban circulation zones and foster life. Considering Lefebvre's trialectic within the space production, streets emerge through the interaction of design, perception, and lived experience. This production cycle recurs over time. Movement is a significant factor that influences street users. During the experience, all sensory organs simultaneously contribute to perception. As the human body navigates across physical space, the eye dynamically shifts its focus toward different perspectives. This study aims to evaluate user experiences and activities within urban streets' perceived and lived spatial context. User experience encompasses diverse sensory aspects, encompassing visual, auditory, olfactory, gustatory, and tactile encounters, all contributing to a multi-sensory perceptual interaction. Initially, an in-depth review of the literature was undertaken. Taxonomies, variables, and classifications were identified. Subsequently, a comprehensive model was formulated. We chose Mevlâna Street, one of the main backbones of Konya, as the case. We divided the street into thirty-two equal parts on the plan. In this context, the street encompasses diverse sensory stimuli, including auditory, olfactory, gustatory, and tactile sensations. The variety of activities on the street could be increased for highly sensually rich streets.

Keywords: Activity, Experience, Multi-Sensory, Street.

1. INTRODUCTION

The human mind constructs reality through experience. The construction process consists of the sensory perception and mental processing of reality. According to the literature on experience, researchers and philosophers attempt to define and comprehend experience from various perspectives. Perception is an element of experience (Merleau-Ponty, 1962, p. 4). The experience of a visual field does not comprise limited data. Numerous variables from the past and future, as well as human emotions such as hope, desire, and wish, round out the experience. Furthermore, light makes visual experience conceivable. Merleau-Ponty (1962, p. 4) describes seeing and hearing as unadulterated experiences. The experience must be brought to consciousness and processed by the brain. However, there are certain filters that intellect employs. Reality and the experience of reality are distinct (de la Fuente Suárez, 2013). There are habits, preconceptions, concepts, individuals, and knowledge in every experience

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

(Oakeshott, 2002, p. 14). Oakeshott (2002) identified sensation, perception, intuition, judgment, emotion, and thought as the fundamental characteristics of experience.

This study aims to investigate the perception of space on city streets. What factors influence the perception of pedestrian space? What coding methodologies do these variables employ? How do variables influence the perception of space? Simultaneously, a table was constructed to depict the experience of space visually. The "0" and "1" system is an experiment to demonstrate the experience. Senses are the origin of experience variables. Therefore, visual, auditory, and olfactory experiences are included. Tasting is excluded because it is subjective, and the experience of space is realized in specific locations, including activity variables. Mevlana Street was selected for the case study.

2. Experience of Streets

Experience originates from cognitive processes and has an abstract nature. In Holl's (2006) analysis, geometry, action, and sensation are distinct components of the overall experience. Pallasmaa (2006) focuses on the role of the senses in shaping the architectural encounter, emphasizing the interconnectedness of sight, taste, hearing, touch, smell, and movement. During the Renaissance, a hierarchical method was used to analyze human sensory perception. The sense of sight was often linked to fire, water, and light, while hearing was related to air. The smell was often connected to steam, taste to water, and touch to the earth as an element. In summary, the senses were believed to have associations with the cosmic body (Pallasmaa, 2006).

According to Merleau-Ponty (1996), the eye, as a self-moving instrument, excites the world and returns it to visible via imprints. Furthermore, Merleau-Ponty (1996) highlights visual experience. Merleau-Ponty (1996) relates the body to the notions of horizon, dimension, dimensionality, thickness, depth, space, and spatiality. Seeing enables us to experience various perspectives in space through the movement of the body and eye. Other sense organs and movements realize the spatial experience to be complete. Merleau-Ponty (1996) asserts that all experiences entail memory, recall, and comparison. In this context, it serves as a form of memory.

Although perception is processed in the brain, it is interpreted using information such as culture, history, education, feelings, and personality traits. Perception and interpretation give rise to our specific experiences. In Figure 1, Tuan (2001) explains the connection between experience, sensation, emotion, and thought. Sensation, perception, and comprehension comprise human experience, and during this experience, sensations increase from perception to sensation, and concepts increase from sensation to perception. According to Tuan (2001) kinesthesia, visual experience, and tactile experience are the concepts that give humans strong feelings about experience and spatial quality.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 1. Experience, emotion, thought Tuan (2001, p. 8)

Lentini and Descartes's (2010) criteria for psychological experience are summarized below.

- Geometric and geographical experience is the experience of the physical elements of the environment, such as distance, structure, form, and position of different elements that make up the space.
- Sensory experience is the sensory experience of the environment, such as color, smell, material, and texture.
- Cultural experience includes behavioral appropriateness, understanding cultural expectations and behaviors, and the consequences of hoped-for and accepted behaviors.

The other two types of experiences, apart from physical, sensory, and cultural characteristics, were associated with the meaning of the space experience. Two types of experience are below:

- Personal experience is an individual experience of space that includes meaning.
- Relational experience involves experiencing the communication possibilities that occur in space.

Geometric, geographical, sensory, cultural, personal, and relational experiences diversify the experience of space, but in reality, the experience of space encompasses them all. Gifford (1983) utilizes personal experience of space to examine interpersonal distance during communication. Perdikogianni (2007) discusses the role of experience in place formation through urban and neighborhood relations. Stavrides (2006) relates the concept of heterotopia to the experience of place. He examines the spatial boundaries of people called others and the processes of becoming compatible/discordant with space. The experience of space continues wherever there is space, in cities, streets, and parks, where human beings complete the sense of space by creating boundaries to the void.

According to Cullen (1961), when buildings are considered to come together as a group, it is seen that the space between them has a life beyond itself and the buildings that make it up. In this context, the environment realizes a sensory reaction. This reaction is manifested in three ways:

- Regarding optics, the act of walking in urban areas produces a variety of visual perspectives. The design aims to develop urban elements that captivate the senses through sequential visual experiences. A lengthy and unvarying road creates a monotonous impact due to the consecutive occurrence of identical elements. Cullen (1961) states that the human mind operates based on

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

contrasts. When there are variations in forms, the impact of sequential perception becomes apparent. Another consequence of serial vision is the attainment of cohesion within urban environments. According to Cullen (1961), the current perspective or perception of the urban environment and the revised perspective transforms the city into a compelling theatrical production.

- Regarding space: How our body senses and reacts to the environment is connected to its position. Upon entering a room, the user subtly conveys the notion of being both outside and inside simultaneously while also acknowledging their presence within the space. In this context, the physical form aligns itself with the concept of space, perceiving it as a dichotomy of "here" and "there." As per Cullen's research in 1961, this sensation is associated with being on the street or in a public square.

- Regarding content: Content is associated with concepts such as color, texture, scale, style, character, and the distinctiveness in shaping a space. When an individual strolls along a street, they observe the coexistence or layering of various architectural styles. When an individual strolls along an unfamiliar street, the individual may observe straight pathways and consistent architectural designs. Cullen (1961) expresses criticism towards similarity. In this context, the presence of content leads to the distinction of urban space. This piece is titled "This and That" and was composed by Cullen in 1961. He eloquently characterizes streets as an urban expanse, carefully selecting his words to convey their essence.

- Engaging in motion: A common human behavior observed on the streets. When individuals come to a halt, their next instinct is to contemplate their next movement. Cullen (1961) suggests a thoughtfully planned pedestrian movement in urban areas akin to the well-organized pedestrian movement within a church. The perception of user movement on the street should be carefully designed from beginning to end.

- Fluidity resistance: Fluidity resistance is encountered in spaces where static and dynamic movements coexist. This term also describes the combination of interior and exterior space.

- Closure: It represents the opening of the interior to the exterior. It is also the complete closure of the envelopment.

- Envelopment: Envelopment involves the envelopment of the walking body or the body in a motor vehicle moving on wheels with the forms around it. In the continuous facades, the movement is held in tension by the rectangular structure that blocks the exit. Furthermore, a momentary balance is established between pure fluidity and envelopment.

-Thereness: When considering the connection between the road and the mountain, it can be observed that the mountain consistently maintains its presence concerning the road. This observation also applies to the streets. On streets that begin and conclude with a square and proceed in a straight line, the square plays a role in walking, sitting, and remaining stationary.

- Level change: Spaces with low ceilings create an enclosed feeling. Spaces that possess greater height evoke a feeling of authority and dominance. As per Cullen's (1961) findings, descending and ascending denote acquiring knowledge, while ascending signifies the path towards the unfamiliar.

- Constriction: These areas denote the convergence of buildings, resulting in narrower spaces between them. It is crucial to regulate the movement of pedestrians in such areas.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

- Revised: The various levels of space that the residents of a town navigate directly influence their senses, and as stated by Cullen (1961), grid plans are thus regarded as conflicting with human nature.

- Appropriateness: This concept relies on the essential aspect of maintaining mutual respect among community members. As per Cullen's (1961) findings, propriety and etiquette are not synonymous. As an illustration, a humble street is adorned with a metallic sign of a shop. While it may not be deemed conventional, it is suitable if this establishment is a metalworking enterprise.

Sheller (2014) discusses kinesthetic experience and how it influences our perception of time space, and ability to adapt to the world. According to Sheller, our kinesthetic sense of body movement is crucial in understanding and interacting with the surrounding environment. According to Sheller (2014) space is generated by the rhythm and friction of the movement flow. The pedestrian is actively participating by moving towards the center of the room. As depicted in Figure 2, the urban setting is meticulously crafted by architects and urban designers, placing significant importance on visual aspects. However, urban livability encompasses more than just visual appeal. It encompasses the overall experience of the street, with various perspectives, sounds, smells, textures, and tastes.

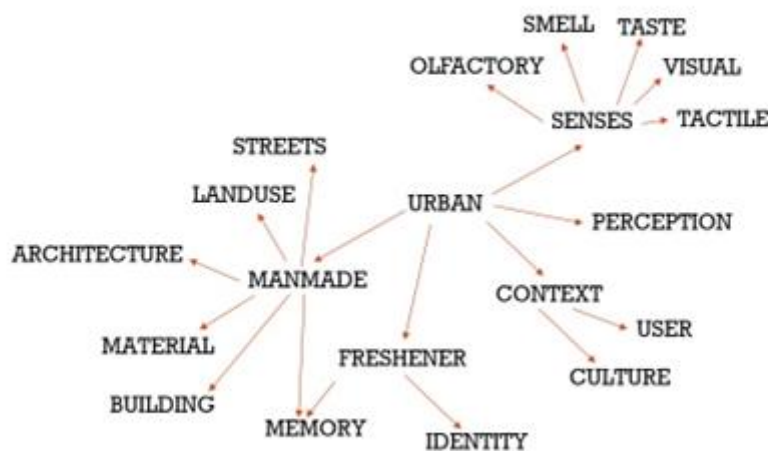

Figure 2. Experience in urban (Temple, 2013)

Visual Experience: The visual experience is a significant way we perceive the street. Numerous factors can influence the experience of perceiving objects in physical space. The human eye can perceive various aspects, such as distance, light changes, and color alterations (Porteous, 1996). According to certain researchers, there is a prevailing characteristic associated with the eye. For instance, Porteous (1996) asserts that in Western cultures, the eye tends to be more dynamic and perceptive than other senses. Pallasmaa, in his book (2011) "Eyes of the Skin," explores this matter and asserts that the sense of touch is equally significant as vision.

When we analyze the attributes of the visual experience, we observe that the sensory organ involved is the eye, the data received is in the form of light, the mode of transmission is also light, the activity of the sensory organ can be described as opening and closing of the eye, the

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

environment's activity is perceived from a particular perspective, the type of action involved is deliberate and controlled, and the perception of depth and direction is achieved through linear perspective. The visual aspects of urban spaces include color, shape, size, volume, density, visual complexity, visual harmony, imaginability, subjectivity, and compatibility with nature (Naghizade & Ostadi, 2014a).

Auditory Experience: As one walks along a lively street, many sounds emanate from various sources, creating a rich auditory experience. Examples of sounds heard on the street include the honking of horns, the sound of people's footsteps, the noises of motor vehicles, and the voices of humans. In contrast to the visual experience, the auditory experience generates spaces that lack distinct boundaries. In this context, the experience of sound is more dynamic than the experience of sight, and it is an experience that cannot be easily concentrated on (Porteous, 1996). Auditory experience encompasses the connection between the sensory environment and one's actions (Diaconu, 2011) and the process of acoustic communication (Truax, 1984) The auditory stimuli that we perceive while walking along a thoroughfare can be categorized into distinct groups, namely human sounds, natural sounds, musical sounds, transportation sounds, and mechanical sounds.

Human sounds can be classified into various categories: walking, running, speaking, laughter, baby crying, and children's voices. Nature can be categorized into various components: sound, plants, animals, and natural elements. Examples of sounds include barking, rustling leaves, thunder, and waves. Music sounds can be categorized into two main types: those created by live instruments and those produced by technical equipment like television and radio. Indoor sounds are categorized as sounds originating from residential dwellings, workplaces, and places of worship. These sounds include the noise produced by showers, toilets being flushed, computers running, and bells ringing. Transportation sounds are the sounds that come from roads, railways, and airlines. These examples include a helicopter, an airplane, a train, and a motor car. Sounds also vary across various streets, each contributing to distinct cultural frameworks. In areas where Christian societies reside, bells can be heard resonating through the streets. Conversely, the call to prayer reverberates through the streets in areas where Muslim societies reside.

When we analyze the qualities of auditory perception, we observe that the ear serves as the sensory organ, and the information received is in the form of sound. The sensory organ becomes activated by auditory receptors. The features of urban space that are perceived through sound include depth, distance, space, and fullness. The characteristics of wall coverings, social communication, traffic, vitality, security, the sound of nature, and vibration are also observed (Naghizade & Ostadi, 2014a)

Olfactory Experience: According to Porteous (1996), smell contains less information and more emotion than sound, environmentally. The olfactory space is an unstructured, overlaid, uncontrolled space. The world of smell is dispersed, incomplete, transient, and sensory (Porteous, 1996). When we move on any street, we feel surrounded by odors. The smell of food, the smell of fresh grass, the smell of flowers, the smell of spices, as well as different odors are encountered on the streets. Toposmia is a term used to make sense of odors' location and relationship with space (Drobnick, 2010) Drobnick (2002) says that olfactory environments are fragrant and picturesque. If we examine the characteristics of the olfactory experience, it is seen that the sense organ is the ear, the received data is odor, and the transfer type is air. Smell

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

receptors activate the sense organ. The universe is the entire field of smell. It is seen that the features of urban space experienced with odor are the presence of natural elements, cleanliness, air pollution, sense of memory and space, and spatial continuity (Naghizade & Ostadi, 2014).

Taste Experience: Food is one of the fundamental necessities for human beings. Additionally, it is one of the factors contributing to the utilization of the street, and the taste experience is pleasurable for the individual. In urban areas, relying on a restaurant or café name to obtain directions is common practice. The location is associated with the sensation of taste. The taste experience in urban space is also associated with our memories. The ice cream we consume while walking along the street and the bagel shop at the street corner assist us in recognizing the specific location. Simultaneously, the duration we allocate to consuming meals outdoors enables us to divert our attention toward additional environmental characteristics on the street (Naghizade & Ostadi, 2014).

The assessment and charting of the culinary encounters in public areas are conducted by sampling the menus offered at various café and restaurant establishments situated along the streets. When we analyze the characteristics of the taste experience, we observe that the sensory organs involved are the tongue and mouth. The data received during this experience includes taste and aroma; the transfer mode is through the mouth. Taste receptors activate the sense organ. Subjectivity is inherent and manifests through action. According to Naghizade and Ostadi (2014), it is imperative to prioritize the aspect of taste. The measurement of taste experience is not included as a variable.

Perceptual system	Sensory organs (receptors)	Receivable information	Transfer type	Affectivity of sensory member	Affectivity of environment	Scope	Action type	Depth and direction of space perception	Perceiving qualities of urban space
Visual	pupil	Light, glittering of color	Media (light)	Open and close pupil	Perspective definition	General	Controlled action	Directional view	Color and form, volume and size, diversity, visual richness, visual coordination, imaginability, visual personality, consistency with nature
Auditory	External and internal ear	Sound (type, direction, distance, source, speech)	Media (sound)	Stimulating hearing receptors	Echo	Public	Reaction	All directional hearing	Depth and distance, full and empty, quality of wall covering, social interaction, rush hour and traffic, vitality, security, sounds and names, natural environment sound, vibration, immediately
Olfactory	Smelling cavity	Smell direction	Media (air)	Nose mucus stimulation	Smelling field definition	Semi-public	Reaction	All directional taste	The presence of natural elements, freshness, environmental pollution and cleanliness, memory and sense of place, spatial continuity
Gustatory	Tongue surface and mouth cavity	Taste and flavor	Media (mucus)	Stimulation of taste buds	-	Personal	Action	Concentrated tasting	Space taste, anchor points, identification of mental reference points
Tactile	The skin of all body surface	Temperature, humidity, tissue quality pressure, pain, tenderness, rapidness, intensity speed	Direct	Deformation, color change and skin tissue, physical and chemical changes of skin	Presence, objects transferring	Fully personal	Action and reaction	All directional access	Environment temperature and humidity, wall material, total volume depth of the element and details, passage of time, belonging feeling, important role, history and the past, restriction, surface flexibility, public arts, durability and stability, continuity of motion, hierarchy, climatic comfort, fourth dimension perception

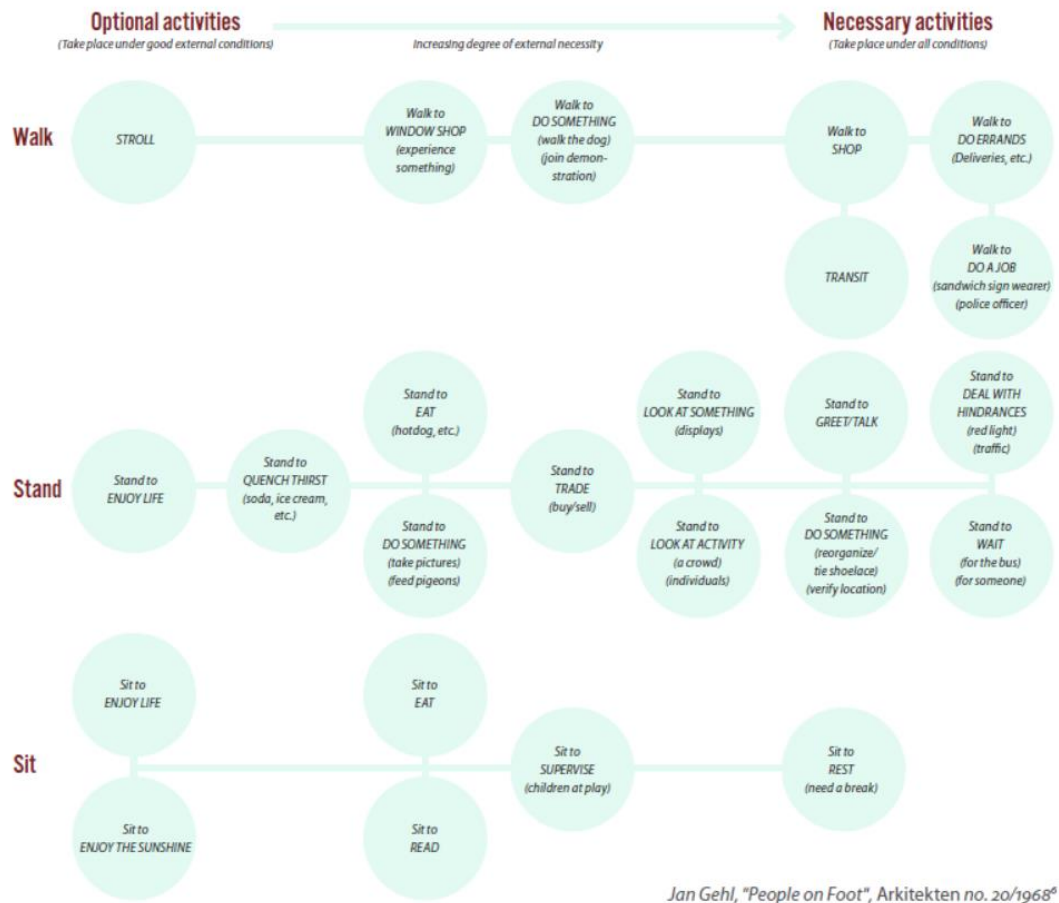

Figure 3. Five senses (Naghizade & Ostadi, 2014)

Tactile Experience: Unlike other sensations, the tactile experience necessitates a more intimate connection with the urban environment. The ground beneath our feet as we walk along any street, the handrail we hold onto when going up or downstairs, and the urban seating areas are physical elements of the city that we can feel through touch. Psychologists have defined tactile experience as encompassing sensations such as warmth, pain, and pressure. Additionally, they

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

provide valuable insights regarding objects' shape and surface characteristics (Diaconu, 2011). Furthermore, it is linked to sensations such as itchiness and tingling and various types of stimuli, including mechanical, chemical, and thermal factors (Naghizade & Ostadi, 2014). Naghizade and Ostadi (2014) classify tactile experiences into four categories based on their type and characteristics. The adjectives used are hot/cold, wet/dry, soft/hard, and smooth/rough.

Figure 3 analyzes the attributes of the five sensory encounters. While visual experiences exhibit general characteristics, auditory experiences occur within specific boundaries. Hence, it exhibits traits that are observable to the public. The sense of smell exhibits certain qualities that can be considered public. The olfactory experience comprises the odor's presence and the individual's subjective perception. Gehl and Svarre (2013) identified walking, standing and sitting as optional activities (Figure 4).

Jan Gehl, "People on Foot", Arkitekten no. 20/1968^o

Figure 4. Activity requirements table (Gehl & Svarre, 2013).

3. MATERIALS and METHODS

This study aims to analyze the perception of spatial elements in urban environments. Firstly, articles, papers, and books about street experience were thoroughly examined. The sensory information received shaped the user's initial experience of the street. The scope encompasses visual, auditory, olfactory, and tactile experiences. Walking is an essential activity for fully

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

immersing oneself in the street environment. We walked through the street. Mevlana Street is a prominent thoroughfare in Konya, a moderately sized city in Turkey. The street holds great historical importance due to the tomb of Mevlana Celaleddin Rumi, a philosopher from Anatolia, and the tomb square along this street. The street was divided into sixteen sections, stretching from Alaaddin Hill to the Mevlana Tomb and vice versa, from the Mevlana Tomb to Alaaddin Hill. An equilibrium was noted in the distribution of roads, buildings, and the proximity of walking distances among the different areas. Video recordings were captured during the walk using a "Goprohero Black 5" camera at a 1.65 cm height corresponding to eye level. These recordings were then documented. The sensory experience was categorized using binary code, with 1 representing the presence and 0 representing the absence of various elements such as nature, music, humans, machinery, transportation, smells related to nature, food, garbage, emissions, synthetic scents, and industrial odors. The 16 spatial cross-sections were sequentially recorded to form an architectural depiction of the fundamental encounter of walking along the street. This study aims to initiate a discussion about the experience of space in creating space rather than seeking to establish absolute and unchanging knowledge.

4. FINDINGS and DISCUSSION

Mevlâna Street is located on the transportation axis between Alaâdin Hill and Mevlâna Türbeönü Square in Konya. When the historical process is analyzed, it is one of the important streets and the main backbone of the city. Many buildings and places of worship are on it, which functions with administration and trade. Historical monuments such as İplikci Mosque, Şerafeddin Mosque, and Konya Governorship Building are also on the street. When local government policies are analyzed, it is seen that Mevlâna Street has been planned with a focus on walking and cycling.

Figure 4. Space Sections on Mevlana Streets

4.1 Visual Experience

Space 1 is located along the route from Alaâdin Hill to Mevlâna Türbeönü Square. The İş Bankası and Tekel Building can be found in this area.

The sidewalk has a width of 4.85 meters. There is a noticeable variation in the heights of buildings in this area. There are a total of eight trees. Simultaneously, six obstacles are identified. The obstacles include electrical panels and lighting fixtures needing to be properly aligned along the street. In this area, designated guide tracks are intended for individuals with disabilities. Despite the absence of designated seating areas, visitors use the stairs within the İş Bank building and the water basins on its facades as alternative seating options. Additionally,

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

electricity panels are utilized as a designated stopping area. In this place, it is observed that children are seated and engaging in begging during the evening hours.

Space 2 is typically the area where the commercial function is concentrated. The variation in the width of the pavement remains consistent. A total of eleven trees and seven obstacles were detected. The height of buildings varies. Within this area, guide markers are specifically intended for individuals with disabilities. The recesses on the building's facade, which are flooded during periods of heavy rain, serve as seating areas for the building's occupants. The merchandise being delivered to the stores is also left on the street.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Space 3 is the location of the İplikçi Mosque on Mevlâna Street. The mosque is a setback, forming a sidewalk wider. There is an elevation difference where the mosque intersects with the sidewalk. The mosque parapets are used as seating areas. Building height movement is constant. Nine trees and three obstacles are identified. The obstacles are electrical panels and pontoons where the street crosses the sidewalk. The user walks quickly in this section. The user proceeds at a rapid pace. The staircase leading to the mosque serves as a designated area for bicycle parking.

In *space 4*, facades are positioned beyond the street border, creating a spatial configuration encompassing an urban park. There are forty trees along the specified path. The rubbish bin and the lighting element pose barriers along the path of space 4. Pontoons are present on the sidewalk. The park has a decorative pool.

Space 5 is located on the facade of the Governor's Mansion. The width of the elevation is variable. Building height is constant. There are five trees in Space 5. There are no urban elements that would be an obstacle. At the beginning of the route, Ulvi Sultan Tomb and Masjid Restoration work is being carried out.

In *space 6*, the facades are set back, which creates a city square. In the square, an entrance leads down to the underground market of Sarraflars. Seating areas and urban furniture are in this space section. No trees were identified in this section. Five pieces of urban equipment create obstacles at the space entrance, including pontoons, lighting elements, and billboards. The sidewalk route is used as a minibus stop. It has been determined that users use urban elements with different functions as seating areas. The user feels sound with the decorative pool.

In *Space 7*, the facades are positioned further back, thereby expanding the width of the sidewalk. The height of buildings can vary. A total of one tree and six obstacles were detected. It is determined that pontoons, billboards, and electric panels pose obstacles along the space route. A commercial establishment that sells date ice cream is identified in this space section.

Space 8 is home to a variety of souvenir shops and restaurants. The width of the pavement is not consistent. In this particular section of the street, there are two trees. The electric panels are positioned to obstruct pedestrians along the street. The height of buildings can vary. The scent of food is particularly noticeable in the area where the restaurants and bars are situated.

In *Space 9*, The pavement's width variation remains consistent throughout this section. There are nine trees. The positioning of the electrical panel obstructs pedestrians. The height of buildings can vary.

In *Space 10*, the width of the sidewalk movement is constant. There are two trees. Four urban reinforcements that will create obstacles are detected. Building height is constant. Pedestrians walk on the street by changing their routes.

In *Space 11*, The width of the pavement exhibits variability. There are two trees. No urban amenities or infrastructure would provide obstacles to pedestrian movement. The height of buildings exhibits variability.

In *space 12*, the sidewalk widens to form a square. Users fed pigeons in the middle of the square. At the entrance of space 12, the electricity pole and the electricity panel are placed in such a way as to create an obstacle for pedestrians.

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Space 13 is where the facades of the "School of Industry" and "Central Bank" buildings are located. The width of the sidewalk is wide. There is no urban equipment in the urban space that would be an obstacle for pedestrians. Therefore, sitting and standing users are encountered.

Space 14 is the section of Mevlâna Street where the Industrial School and the Central Bank are located. The Central Bank is planted backward, creating a green zone between the sidewalk and the building. There are 30 trees in this space. The width of the sidewalk is constant. The building height movement is constant, and there are no obstacles that would make user movement difficult.

In *Space 15*, there are trade and banks. The width of the elevation is constant. Building height movement is constant. Eight trees and five obstacles are parts of the street. Food odor is detected in this section in the morning, afternoon, and evening. Shopkeepers put on stools in the morning and night and use the sidewalk as a seating area. The guide tracks designed for people with disabilities continue until the end of the space and end with the end of the space. People were eating and standing up.

In *space 16*, the change in the width of the sidewalk is constant. However, the elevation is back 10 meters to form a small square. Building height movement is constant. One tree obstacle is detected.

4.2.Sensory Experience

When the sensory variables determined in the taxonomy from Mevlana Street are examined, the space sections have different variables. When the auditory experience variables are examined, it shows that the sound of nature is felt in certain parts of the street. The fact that the perimeter of the rocky park is parallel to the street allows this sound to be heard. Music sounds usually come from the gift shops on the street. People are only present in each section. No mechanical sound is detected on the street. Transportation is heard in every part of the street except the sixth section. Since the bus stops are in this area, no sound is felt during walking. When the odor experience variables are analyzed, it is observed that there are different odors on the street. The smell of nature is present in a specific part of the street, especially where the sound of nature is felt. Although the smell of garbage is not felt, the smell of emission is felt intensely due to the traffic on the street. Synthetic cleaning and industrial odors are not detected on the street (Table 2).

5. CONCLUSION and RECOMMENDATIONS

The results are summarized below.

* The street has different visual experience characteristics. Buildings are set back, and public spaces are formed on the street.

* There is a green texture on the street.

* There is intense vehicle noise and emission odor due to traffic.

* There is no garbage odor.

* Taxonomies were evaluated in general and not divided into sub-headings. Visual experience elements and sensory experience elements have been documented as part of the experience of the space on the street. However, there are different and complex variables for determining the experience of space. Therefore, definite, and unchangeable conclusions cannot be reached. In this context, experience is subjective. Time can significantly differentiate these variables. For this reason, every person at every moment and different forms of movement on the street constitute different experiences of space and subjective production of space.

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

For this reason, walking variables on Mevlana Street between 10:00-10:20 on 8.08.2018 belong only to the researcher and that moment. However, generalizations can be made when the number of people and time is increased.

Thanks, and Information Note

This paper is part of a Ph.D. dissertation entitled "Investigation of Movement Experience in Streets," prepared by Özlem Demirkan under the supervision of Prof. Dr. Kerim Çınar in KTO Karatay University Graduate School of Natural and Applied Sciences, Department of Architecture.

ABSTRACT

Technological advancements have enabled combining design education with innovative learning tools. The concept of gamification and game design principles has recently gained significant traction across various domains. Their efficacy in engagingly imparting complex and interdisciplinary skills has been well-established. Professionals in the field suggest that integrating game design principles and gamification techniques into existing educational programs can yield noteworthy benefits, including creating valuable resources that enhance the grasp, involvement, and expertise of challenging technological proficiencies, particularly for novices in the field. This paper aims to review and analyze research that focuses on implementing gamification in education. The study will specifically examine various case studies that have been chosen based on their integration of game design and the feasibility of gamification in educational settings. By conducting this thorough analysis, the paper proposes a gamification framework that can be applied to architectural education within the design studio context. The framework will define and illustrate how gamification and rule-based design methodologies can facilitate knowledge acquisition and enhance deep learning in architectural design compared to conventional design studio pedagogy.

Keywords: Design Education, Gamification, Game-Based Learning.

1. INTRODUCTION

The design studio plays a vital role in undergraduate architecture education, serving as a core component of the curriculum. Its framework and material promote interactive learning, peer teamwork, and self-reliance. A designated physical space, the studio provides students with a platform to articulate and exchange creative concepts and works. Moreover, online learning platforms utilizing gamification techniques offer personalized pedagogical methods in design and architecture education. Students can benefit from a flexible and adaptable learning model by leveraging these digital resources.

As the COVID-19 pandemic emerged, transitioning to distance and online education has brought about complex reactions, particularly in design disciplines like architecture. (2020a; 2020b)The physical nature of design and studio-based education makes it challenging to adjust to the restrictions and limitations imposed by the pandemic. The absence of physical interactions and activities in the studio environment has negatively impacted teachers and learners, eliminating the unique possibilities only available in a studio setting (Brown, 2020).

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Architectural education, in particular, is known for its resistance to pedagogical change. However, urgent action had to be taken, and the first step was to switch to "distance education." Despite this, the learning experience produced by the studio cannot be easily replicated in a digital environment. Therefore, it has become crucial to explore pedagogies suitable for the "digital environment" by examining current approaches to design education in the context of architecture and how learning outcomes are organized.

There were quite complex reactions, especially in design disciplines such as architecture, during the transition to distance and online education that emerged with the COVID-19 pandemic, which has been ongoing since 2020. Design, and especially studio-based education, are activities that take place physically. Restriction/elimination of activities and interactions in the physical environment negatively affects the teacher and learner by eliminating the possibilities created by the studio. In particular, architectural education, one of the disciplines most resistant to pedagogical change, had to first switch to "distance education" as an urgent action. However, considering the learning experience produced by the studio, it has become essential to look for pedagogies suitable for the "digital environment" by examining current approaches to how design education is provided in the context of architecture and how learning outcomes are organized.

A Framework for Design Studio Pedagogy

The differentiation of the design studio from theoretical courses in terms of load and duration is a significant difference that increases the diversity of methods and pedagogical approaches. However, as the creativity and criticality of design studio facilitators increase, facilitators also incorporate radical pedagogical approaches, practices, and activities into their teaching processes. This situation reveals different learning situations and educational approaches that vary from school to school and from person to person. For this reason, the design studio has different characteristics depending on the conditions it operates in and the actors it hosts, and the common point of these characteristics is that they need to be defined (Anthony, 2014) consistently. According to Pendleton-Julian (2010), a design studio is a structure that is open-plan and contains a lot of educational content, which differs from other learning experiences, primarily normative pedagogy models, where formal and informal communication and socialization between all actors continue, not a one-way transfer of information from the teacher to the learner. Meanwhile, a series of learning takes place in which knowledge is assimilated, and skills are built. This learning is a way that meets the program qualifications but is of such complexity that the learner can determine his learning route.

Design studio, with its diversity mentioned above, can be discussed within the following framework (Pendleton-Julian, 2009, 2010):

1. While the studio is built around a specific issue and problem (real or hypothetical), the issues/problems are multidimensional. In this case, the learner has to be nourished by many fields of knowledge and be able to establish/follow the relationships between these fields.
2. The studio is social by nature. The learner learns with motivation, acquiring knowledge and skills from a creative position. It is a learning environment where one tests these knowledge and skills in dialogue with the facilitator and peers while putting them into practice.

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

3. In the studio, criticism/discussion over the act of making and the resulting outcome of doing is the primary operator. While working in a field without a single direction or answer, feedback takes place through discussions as the learner articulates his ideas and suggestions with representation tools.
4. The studio is synthetic; synthesis occurs through repeated actions. In the studio, unlike normative pedagogies, the problem is not a focus awaiting a solution in accordance with specific rules but is a tool for productive inquiry. When this questioning occurs in an environment with more than one student, in a non-isolated manner, The learner will build knowledge by testing what he has acquired from a great variety.
5. At the most basic level, the studio supports knowledge-building and skills development. Instead of this being one-way, the studio tries to establish an environment where knowledge spreads and finds more ways within a community that learns by doing.
6. 'Studio culture,' which is frequently emphasized by accreditation institutions, refers to a learning environment where these conditions are met. (such as; MIAK: www.miak.org, NAAB: www.naab.org)

Based on this framework, it is necessary to focus on which potentials of the 'interactive new digital environment' can be associated with 'peer learning,' 'learning by doing' and 'socially situated learning' pedagogies and which new learning pedagogy can be theorized. Associating these pedagogies with 'gamification' can be discussed as a potential learning model.

Learning Theories Associated with the Design Studio

To thoroughly analyze the learning pedagogy of a studio and identify the key components that comprise the studio environment, it is crucial to look at the learning theories hinted in the framework. What are the essential factors, practices, and social dynamics contributing to creating a learning atmosphere in the studio? By examining five critical learning theories associated with the design studio pedagogy, we can gain a more profound insight into optimizing the studio's potential as a space for learning and development, benefiting both learners and educators.

One of the critical theories applied to the design studios is self-constructive learning, an approach to education that emphasizes the learner's active role in acquiring knowledge and skills (Ersine & Takkeci, 2017). It is a student-centered approach that emphasizes the development of critical thinking, problem-solving, and metacognitive skills (Torun, Tekçe, & Esin, 2011). In self-constructive learning, students are encouraged to take ownership of their learning and engage in inquiry and discovery. Self-constructive learning is based on the idea that learning is not a passive process but an active one that involves the construction of knowledge through integrating new information with existing knowledge. This approach recognizes that learners bring their experiences, beliefs, and perspectives to the learning process. These factors play a significant role in shaping their understanding of new material. Self-constructive learning is characterized by several key features, including using open-ended questions, promoting student autonomy, and emphasizing reflection and self-evaluation. Open-ended questions encourage students to explore a topic in-depth and develop their ideas and perspectives. Student autonomy is promoted through activities that allow students to choose what they learn and how they learn it. Reflection and self-evaluation help students monitor their progress and identify areas where they need additional support.

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

Another theory associated with the design studio is the Zone of Proximal Development (ZPD), a term coined by Lev Vygotsky, a Russian psychologist and social constructivist, to describe the range of tasks a learner can perform with the guidance and assistance of a more knowledgeable other. It refers to the gap between a learner's current level of understanding and their potential level of experience with the help of an expert or a peer. According to Vygotsky, learning occurs when a learner can engage in activities beyond their current level of understanding but not so far beyond that they are unable to complete the task even with support (Vygotsky, 1980). In other words, the ZPD is where a learner can make the most progress in their learning. The ZPD is often illustrated as a range between what a learner can do independently and what they can do with assistance. Teachers and educators need to identify the ZPD of their students to provide appropriate guidance and support. By providing tasks within a student's ZPD, educators can help students progress in their learning by scaffolding their understanding and building on their prior knowledge (McLeod, 2022; Zhang et al., 2018). The ZPD is not a fixed concept and can change over time as a learner's understanding and skills develop. As learners progress and become more competent in a particular area, the ZPD shifts and expands, allowing them to take on more complex tasks more independently.

Built upon these theories, cognitive apprenticeship is a theoretical framework for learning that emphasizes the importance of social and cognitive processes in developing expertise. Collins, Brown, and Newman first introduced the concept of cognitive apprenticeship in the late 1980s to describe how experts transfer their knowledge and skills to novices (Brown, Collins, & Newman, 1987). The framework is based on the idea that learning is a social process that occurs through a combination of observation, imitation, and practice. In cognitive apprenticeship, learners are paired with expert practitioners who serve as mentors and guides in the learning process. These mentors allow learners to observe and participate in authentic tasks while providing feedback and support. A focus on developing metacognitive skills, such as problem-solving, decision-making, and self-evaluation, characterizes cognitive apprenticeship. The cognitive apprenticeship framework includes several critical principles designed to support learning and the development of expertise. These principles include modeling, coaching, scaffolding, articulation, reflection, and exploration (Dennen, 2003; Redmond, 1992). Modeling involves demonstrating expert thinking and behavior, such as using effective problem-solving strategies and techniques. Coaching consists of providing guidance and feedback to learners as they practice new skills and solve problems. Scaffolding involves gradually removing support as learners become more competent, allowing them to take on more complex tasks with increasing independence. Articulation involves the explicit description and explanation of the thought processes and strategies used by experts as they solve problems. Reflection consists of the opportunity for learners to review and evaluate their performance, focusing on identifying strengths and weaknesses. Exploration involves allowing learners to experiment with new ideas and approaches in a safe and supportive environment. The cognitive apprenticeship framework has been applied in various contexts, including education, training, and workplace learning. Research has shown that cognitive apprenticeship can effectively develop expertise, particularly in complex and dynamic domains with high uncertainty and ambiguity (Minschew, Olsen, & McLaughlin, 2021; Pieters & de Bruijn, 1992; Redmond, 1992).

As a critique of cognitive apprenticeship, Lave and Wenger (1991) introduced the concept of situated learning as a theoretical framework emphasizing the importance of context in acquiring and applying knowledge and skills. Learning can be viewed as an active process through

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

meaningful and authentic engagement with specific social and cultural contexts. In this perspective, the transfer of knowledge is not a one-way street; rather, it is a continuous and dynamic construction that stems from the interaction between the learner and their environment. The emphasis here is on the value of authentic and relevant tasks that are directly tied to real-world contexts, as well as the importance of social interaction and collaboration in facilitating the learning process. By providing opportunities for learners to engage in relevant and meaningful activities, this approach aims to create an environment that encourages a deeper understanding of the subject matter and a more active and engaged approach to learning.

The "Projective Identity" theory by James Paul Gee emphasizes the significance of learners adopting new identities as they participate in learning and problem-solving endeavors. It proposes that learning encompasses more than just acquiring new knowledge and skills, but also involves a transformation of oneself (Gee, 2003, 2008). Gee suggests that learners can develop projective identities by adopting experts' attitudes, behaviors, and values in a specific domain. This requires learning new information and adopting a fresh perspective towards problems. In scientific fields, the projective identity concept holds particular importance as learners need to adopt a scientific mindset to engage in scientific inquiry effectively. By assuming the identity of a scientist, learners can approach problems systematically and analytically, employing creative problem-solving techniques essential to scientific discovery. This theory has significant implications for educators, who must create learning environments that facilitate learners in adopting new identities as they engage in learning activities. This may involve providing opportunities for learners to work alongside experts in a particular domain or engage in activities that enable them to adopt the attitudes and behaviors of experts. Overall, Gee's projective identity theory provides a valuable framework for understanding the role of identity in learning and problem-solving. It underscores the significance of developing learning environments that promote the formation of new identities and ways of thinking, particularly in fields that require a specific mindset for effective engagement.

Gamification as a Potential Unifying Framework For Distance Education

Gamification is a highly effective tactic that entails incorporating game-like elements into non-gaming contexts. According to Salen and Zimmerman (2003), the game is defined as a system in which players deal with an artificial problem, defined by rules, resulting in a measurable output. Game mechanics also create motivation to learn the situation in the game, focus attention, and can be used for continuous evaluation.

According to Shute and Ke (2012), the games designed have the following features:

1. Ongoing interactive solution generation
2. Specific goals and rules that keep the player focused and motivated
3. Adjusting the difficulty of the game and adapting the difficulty level according to the increasing knowledge and skills of the player
4. Player control of the game, the game environment, and the learning experience
5. Instant and continuous feedback
6. Uncertainty and surprise factors

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

7. Keeping the player in the game through sensory stimulation through the use of different media

Games are of interest to educators as environments for digital literacy and expression, and as potential tools for learning (Bogost, 2005; Gee, 2003; Prensky, 2001). Many studies show that digital games help students improve their knowledge of certain concepts. According to Gee (Gee, 2008), well-designed games already benefit from specific learning theories. Learning science experts, educational content designers, and educators state that digital games can support knowledge (basic sciences, mathematics, language, etc.) and skills (problem-solving, critical thinking, and computational thinking). This potential brings forth studies such as game-based learning, game-based evaluation, serious games, educational games, and gamification.

Gamification has a similar set of learning supports that a design studio consists of and presents an opportunity waiting to be explored. These supports can be grouped under eight categories (Shute & Ke, 2012). The mechanics of game-based learning can be broken down into several categories, each with its tools and techniques. Reflection is one category that focuses on the learner's performance and aims to increase learning during the game. This can be achieved through various supports such as self-explanation, elaborations, and assignments. Modeling is another category that includes interpretations and examples of solving problems or performing tasks within the game. This category includes scaffolding, expert solutions, and working examples. Suggestion is a category that guides the learner from an expert or the game itself to get the learner moving in the right direction without revealing the solution. Collaboration is a crucial aspect of games that support all players to understand better the knowledge and skills required by discussing the game or a specific point in the game, which forms and maintains the community. Interaction and narrative components focus on supports created by giving learners more choice and control. Feedback is an important category that includes formative feedback, which is crucial for the learner. There are different types of feedback available, corrective (yes/no) and explanatory (indicating why the answers are correct/wrong) feedback being the most common. Finally, the modality is a category that focuses on the modalities (auditory, visual, textual) through which learning supports can be provided. Each type has a different impact on learning, which varies depending on the learning environment.

Considering these supports, gamification can be a robust strategy that can profoundly impact online design studios, specifically in creating immersive and compelling learning experiences for students to overcome. By integrating gamification techniques into the studio, instructors can motivate active participation and encourage creativity among students while simultaneously nurturing their problem-solving skills. The potential of gamification in providing students with invaluable design skills, such as critical thinking, collaboration, and communication, cannot be overstated. These skills are of utmost importance for success in architecture and can be effectively honed through the gamification of learning. By creating an engaging and interactive learning environment, students are more likely to be motivated and invested, leading to superior learning outcomes.

2. CONCLUSION

How will linear learning constructs respond to rapid cultural changes in disciplines that require individual autonomy, self-reaction, and self-awareness during the learning phase? Instead of tutor-centered and linear constructs that teach design education, can learning be decentralized,

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

networked, systematic, scalable, and spontaneously adaptable by leveraging online new media opportunities and gamification processes?

Studying architectural design studio education requires diverse skills and a deep understanding of abstract concepts. To lay the foundation, students must possess a multi-faceted skill set and a nuanced comprehension of complex ideas, and this is a challenging process in online learning environments. Recent advancements in gamified educational products have shown the potential benefits of incorporating elements such as point systems and social networks to create a more engaging and interactive learning experience for design students. By utilizing these gamified elements, architecture design students can engage in an educational environment that promotes long-term retention of crucial concepts. It may also be beneficial as it allows instructors to motivate students, nurture their problem-solving skills, and promote creative thinking. This type of learning can also help students develop essential design skills such as critical thinking, collaboration, and communication. By creating a more engaging and interactive learning environment, students are more likely to be motivated and invested in their education, leading to better learning outcomes.

Despite the challenges posed by game literacy, scale, and implementation, gamification and game design principles offer a wealth of potential for enhancing the educational experience of architectural students. By presenting complex concepts like spatial understanding engagingly and interactively, these approaches pave the way for integrating new technologies in the field and promise to improve students' learning outcomes.

Thanks and Information Note

This article covers the process of the ongoing Ph.D. study under the supervision of Arzu Erdem at the Istanbul Technical University, Graduate School, Architectural Design Computing Doctorate Program.

ABSTRACT

The concept of visibility is the basic representation of the normal physical transparency of the atmosphere. Based on this explanation; visibility means the transparency of the air. Smoke, dust, humidity and water vapor suspended in the atmospheric environment interfere with the quality of vision. These suspended atmospheric phenomena constitute the main components of the haze. The concept of haze is a meteorological event that occurs when water vapor near the earth's surface condenses and the point of view is below 1 km. Haze prevents us from seeing the colors, forms and textures found in the natural landscape. Various visual impact studies have been evaluated. As a result of the evaluations, the visual elements of line, color, measure and texture were examined. Within the scope of the study; the effects of haze effect on readability at the reinforcement level in physical spaces were considered. In this context, recreation areas located in the Çanakkale city center have been preferred as a working area. The designated areas were supported by on-site observation, examination and photography. The study aims to evaluate haze perception in recreational landscape areas by landscape perception criteria. In this context; visual landscape perception criteria were determined, the current conditions of the designated areas were observed, examined and photographed, haze effect management was performed by determining the visual landscape perception value of the current situation, and recommendations were created to improve visual landscape perception values. During the evaluation, a decrement between 1-5 was made and suggestions were presented in terms of improving visual perception.

Keywords: The Concept of Haze, The Effect of Haze on the City, Visual Landscape Perception Values, the Concept of Haze in Çanakkale.

1. INTRODUCTION

The concept of visibility constitutes the basis of the physically present transparency of the atmosphere (Tang, et al., 2016). When viewed in this context, visibility is expressed as the transparency of the air. Smoke, dust, moisture and water vapor suspended in the atmosphere cause the formation of haze, which reduces visibility and prevents it (Watson, 2002). The basis of the haze structure is formed by these small particles suspended in the atmosphere. Particles present in the atmosphere reduce visibility all the time.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

According to the Korea Meteorological Administration, the concept of haze is defined as occurring when water vapor near the earth's surface condenses and reduces visibility below 1 km. Within the scope of this explanation, haze is defined as a meteorological event (Bei et al., 2016). Haze also affects the color, form, and texture of the natural landscape because it blocks vision. When viewed in this context, the intensity of the haze affects the extent to which we can see the natural landscape.

There are various visual impact assessment studies conducted. Various elements have been identified within the scope of these studies. These elements are; line, color, size, and texture. These identified elements enable users to perceive the natural landscape and place it in their memory.

Color, which is one of the visual effect elements, is the effect that occurs in the brain as a result of the reflection of light beams hitting objects. Colors enable objects to be perceived as far or near, hot or cold (Alakuş, 2009). Colors also form the perception of the spaces where they are located along with objects. The perception of temperature and coldness in places is provided by colors. The concept of color in landscape designs is vegetative and structural (water, soil, flooring, reinforcement element, etc.) constitute the themes. These elements, which are created harmoniously in the color angle, constitute a whole and unity.

Texture, which is one of the visual impact elements, is defined as the degree of smoothness on the surfaces of objects. Textured surfaces ensure the formation of perception for all users. For example, disabled walking paths located on walking paths allow visually impaired individuals to perceive the roads. At the same time, different textured surfaces can enable these individuals to perceive where they are. The concept of texture in the landscape changes depending on the existing plant area or the distance to the plant. If the current distance is far enough away from the plant area or plants that differences can be seen, the perception of texture will change depending on the plant grouping or the area covered by the plant. The plant groups created in the landscape should be of different textures. These groups with different textures seem more lively to users. But when trying to use different tissues, too much variety should also be avoided. Areas with too much diversity provide users with the perception of complexity and excessive mobility (Robinson, 2004).

The line, which is one of the visual impact elements, is the edge that causes the formation of shape and form. The line source is formed by natural means or man-made materials (Ayaşlıgil, 1998). There are lines in nature. But these lines are not strong, strong, and pronounced like pedestrian paths that are man-made. Branches, stems, leaf structures, and shadows of plants found in nature can be given as examples. The formation of leaf tissues and different colors found in plants allows the formation of imaginary lines (Walker, 1991).

There are different structures of the line, which is one of the visual impact elements. The horizontal lines in the landscape create a feeling of stillness and rest. Vertical lines, on the other hand, create a sense of size, mobility, and emphasis. Plants create an assertive, effective, and accentuating effect on the vertical lines found in the landscape in the field. The drooping lines used in the landscape attract attention and perception to the ground due to the energy and orientation they carry. Diagonal lines in the landscape, on the other hand, provide an exciting effect by energizing the area and the user (Robinson, 2004).

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

The measure, which is one of the visual impact elements, covers the size differences of objects formed between each other. Dec. The sizes of the objects used in landscape designs should be proportional and in harmony with each other (Güney, 1992). When making designs, if the measurements of objects are made incorrectly, it creates physical and psychological negativity for the users. Physically occurring disadvantages can be exemplified in the form of difficulty in use, insufficient movement space, or more movement space than necessary. Psychological disadvantages can be exemplified in the form of feeling under pressure on narrow roads and feeling small in large terrace areas. At the same time, designs that cannot be made in accordance with the human scale also eliminate the perception of the beauty of spaces from the point of view of users (Uzun, 1999).

Within the scope of this study, the effects of haze, which is an atmospheric phenomenon, on the legibility and perceptibility of accessories and areas in physical spaces have been studied.

2. MATERIALS and METHODS

As a field of study; It constitutes recreation areas located in the center of Çanakkale, which is located within the boundaries of the city of Çanakkale. In determining the areas located in the city center, the areas included in the Sağlık ve Kelkit study (2014) were preferred. The preferred areas in this context are;

1. Yeni Kordon
2. Around Sarıçay
3. Halk Garden
4. Eski Kordon
5. Özgürlük Park

Figure 1. The Locations of the Study Areas in Çanakkale (by changing from Google Earth).

Within the scope of the study, a literature search was conducted in order to obtain information about the subject. Within the scope of the literature search; visibility, haze, which is a factor affecting visibility, and visual landscape perception, for concepts and studies related to articles, journals, books, etc. written sources were examined. On-site observations and investigations were carried out in the designated areas. In addition to these observations and investigations,

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

on-site photography was carried out in the area and in the immediate vicinity. The findings made and obtained were evaluated within the scope of the determined criteria.

- The aim of the study is to evaluate the landscape areas with haze perception according to visual landscape perception criteria. The structure of the study;
- Determination of visual landscape perception criteria,
- On-site inspection, observation and photographing of the current conditions of the selected areas,
- Haze effect method to determine the visual landscape perception value of the current situation,
- It is in the form of evaluation within the scope of visual landscape perception values.

A haze effect has been given at 4 different rates on the photos taken to make field evaluations. After this haze effect was added to the photo, the visibility of color, form, line, texture and dimension in the haze effect was evaluated from visual landscape perception criteria. Scoring has been made for each evaluation. The scores made have been transferred to the tables. In the evaluation scoring; 1 point-does not appear at all, 2 points-does not appear, 3 points-may partially appear, 4 points-may appear and 5 points-may appear very well.

3. FINDINGS and DISCUSSION

Yeni Kordon

It is located between Hamidiye Tabya and Kolin Hotel from the north and south sides of Çanakkale city and between Atatürk Street and the sea from the east and west sides. Decadence of Çanakkale city is Decadence of Çanakkale city. It covers a total area of 20,480 square meters. 65% of the total area is designed as a hard floor and 35% is designed as a soft floor. As the predominant vegetation in the area; iğde (*Eleagnus sp.*), California fan palm (*Washingtonia filifera*), maple (*Acar sp.*), stunted pitosporum (*Pitosporum Tobias 'Nana'*) and oya tree (*Lagerstroemina indicated*) were used (Sağlık, 2014).

There are uses with different usage conditions in the field. These uses are residential areas, industrial and commercial areas, public spaces, and other areas. In this context, residential areas are multi-storey buildings. Areas located as public facilities; There are structures such as KYK administrative building, student dormitory, military facilities, and Çanakkale Meteorological Directorate. The sea-facing sides of these areas are generally planned as a garden (Sağlık, 2014). As other areas of use, there are kefes, walking paths, bicycle paths, otuma-recreation areas, children's playgrounds and open green areas. These areas allow users to do various recreational activities. Activities such as various concert events, open-air cinema have come to the fore recently. In this context, the usage intensity of the area has increased in recent periods.

Figure 2. Yeni Kordon walking path and bicycle path (Original, 2023).

The visual figure taken for the area where the Yeni Kordon walking and cycling path is located is given in Figure 2. Figure 2a refers to the visuals where the haze effect is 0%, Figure 2b where the haze effect is 33%, Figure 2c where the haze effect is 66%, and Figure 2d where the haze effect is 100%. An evaluation has been made in this context. The visual area given in Figure 2a can look very good (5 points) within the scope of landscape perception criteria (color, form, line, texture, and size). The landscape perception of the visual area given in Figure 2b is scored as visible (4 points) depending on the percentage of the applied haze effect. The landscape perception of the visual area given in Figure 2c is scored as partially visible (3 points) depending on the percentage of the applied haze effect. In Figure 2d, the landscape perception of the given visual area is scored as invisible (2 points) depending on the percentage of the applied haze effect. Within the scope of the evaluations, the fact that the area is open and the air flow is present prevents the haze rate from being visible at all (1 point) even when it is 100%.

Figure 3. Yeni Kordon children's playground (Original, 2023).

Yeni Kordon is given in the visual Figure 3 taken for the area where the children's playgroup is located. Figure 3a refers to the visuals where the haze effect is 0%, Figure 3b haze effect is 33%, Figure 3c haze effect is 66%, and Figure 3d haze effect is 100%. An evaluation has been made in this context. The visual area given in Figure 3a can look very good (5 points) within the scope of landscape perception criteria (color, form, line, texture and size). The landscape perception of the visual area given in Figure 3b is scored as visible (4 points) depending on the percentage of the applied haze effect. The landscape perception of the visual area given in Figure 3c is scored as partially visible (3 points) depending on the percentage of the applied haze effect. In Figure 3d, the landscape perception of the given visual area is scored as invisible (2 points) depending on the percentage of the applied haze effect. Within the scope of the evaluations, the fact that the area is open, by the sea and the air flow prevents the haze rate from being visible at all (1 point) even when it is 100%.

Around Sarıçay

It is located between Çamenlik Castle and Setboyu Street and DSI Sarıçay Avenues from the north and south sides of Çanakkale city, and between Troya Street and the sea from the east and west sides Dec. It covers a total area of 157,640 square meters. Sarıçay, which has a total length of 40 km, is fed by streams located on Kirazlı Mountain, Aladağ and Kayalı Mountain. 65% of the total area is designed as a hard floor and 45% is designed as a soft floor. As the predominant vegetation in the area; oleander (*Nerium oleander*), sycamore (*Platanus sp.*), larch (*Pinus nigra*), maple (*Acer sp.*), and acacia (*Acacia sp.*) have been used (Sağlık, 2014). Sarıçay Dardanelles divides the center into two and merges with the Bosphorus.

Sarıçay center, which is very important in terms of the history of Çanakkale, forms the boundaries of the New Cordon and the Old Cordon with its division into two. There are a total

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

of 5 bridges over Sarıçay. These bridges are the transit routes that urban residents use extensively. There are grass areas, children's playgrounds, fishing shelters, cafe-restaurants, sitting-recreation areas, and jogging and walking areas in and around Sarıçay. These areas allow users to do various recreational activities.

Figure 4. Sarıçay (Original, 2023).

The visual figure taken for the Sarıçay walking path and its surroundings is given in Figure 4. Figure 4a refers to the images where the haze effect is 0%, Figure 4b refers to the haze effect is 33%, Figure 4c refers to the haze effect is 66%, and Figure 4d refers to the haze effect is 100%. An evaluation has been made in this context. The visual area given in Figure 4a can look very good (5 points) within the scope of landscape perception criteria (color, form, line, texture, and size). The landscape perception of the visual area given in Figure 4b is scored as color and texture criteria may partially appear (3 points), form, line and measure may appear (4 points) depending on the percentage of haze effect applied. The landscape perception of the visual area given in Figure 4c is scored as color, form and texture are invisible (2 points), and line and measure are partially visible (3 points) depending on the percentage of haze effect applied. In Figure 4d, the landscape perception of the given visual area is scored as color, form and texture do not appear at all (1 point), line and measure do not appear (2 points) depending on the percentage of the applied haze effect. Within the scope of the evaluations, it is seen that it can Decipher the line and measurement criteria even if they are between 100% and none in terms of their length in the field and creating orientation.

Figure 5. Sariçay Bridge and its surroundings (Original, 2023).

The visual figure taken for the Sariçay bridge and its surroundings is given in Figure 5. Figure 5a refers to the visuals where the haze effect is 0%, Figure 5b refers to the haze effect is 33%, Figure 5c refers to the haze effect is 66%, and Figure 5d refers to the haze effect is 100%. An evaluation has been made in this context. The visual area given in Figure 5a can look very good (5 points) within the scope of landscape perception criteria (color, form, line, texture and size). The landscape perception of the visual area given in Figure 5b is scored as color and texture criteria may partially appear (3 points), form, line and measure may appear (4 points) depending on the percentage of haze effect applied. The landscape perception of the visual area given in Figure 5c is scored as color, form and texture are invisible (2 points), and line and measure are partially visible (3 points) depending on the percentage of haze effect applied. In Figure 5d, the landscape perception of the given visual area is scored as color, form and texture do not appear at all (1 point), line and measure do not appear (2 points) depending on the percentage of the applied haze effect. Within the scope of the evaluations, it is seen that it can Decipher the line and measurement criteria even if they are between 100% and none in terms of their length in the field and creating orientation.

Özgürlük Park

It is located between Özgürlük Street and Zübeyde Hanım Street from the north and south sides of Çanakkale and between Özgürlük Street and the military area from the east and west sides. It covers a total area of 57,000 square meters. 40% of the total area is designed as hard floor and 60% as soft floor. As the predominant vegetation in the area; oak (*Quercus L.*), ornamental plum (*Prunus ceracifera*), juniper (*Juniperus sp.*), oleander (*Nerium oleander*) and thuja (*Thuja sp.*) have been used (Sağlık, 2014).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Özgürlük Park is an important recreation monument of the city of Çanakkale. There are various activity areas, a walking path, a bicycle path, an animal-friendly park, children's playgrounds, sports fields and a tea garden. These areas allow users to do various recreational activities. According to the location of the area, it sees the city and the Dardanelles Strait as a bird's eye view. There are relaxation areas and seating groups for users in this landscape area. There is mainly a grass texture as an open green area within the area. Users participate in activities such as concerts and various events on grass fields in summer. The user base is diverse because the area appeals to all age groups.

Figure 7a refers to the visuals where the haze effect is 0%, Figure 7b refers to the haze effect is 33%, Figure 7c refers to the haze effect is 66%, and Figure 7d refers to the haze effect is 100%. An evaluation has been made in this context. The visual area given in Figure 7a can look very good (5 points) within the scope of landscape perception criteria (color, form, line, texture and size). The landscape perception of the visual area given in Figure 7b is scored as visible (4 points) depending on the percentage of the applied haze effect. The landscape perception of the visual area given in Figure 7c is scored as partially visible (3 points) depending on the percentage of the applied haze effect. In Figure 7d, the landscape perception of the given visual area is scored as invisible (2 points) depending on the percentage of the applied haze effect. Within the scope of the evaluations, the fact that the area is open, high and has air flow prevents the haze rate from being visible at all (1 point) even when it is 100%.

Eski Kordon

It is located between between sea and İnönü Street from the north and south sides of Çanakkale city and between Piri Reis Street and Sarıçay from the east and west sides. It covers a total area of 67,000 square meters. 80% of the total area is designed as hard floor and 20% as soft floor. As the predominant vegetation in the area; sycamore (*Platanus sp.*), California fan palm (*Washingtonia filifera*), beech (*Fagus sp.*), ash (*Fraxinus sp.*) and Elm (*Ulmus sp.*) have been used (Sağlık, 2014).

According to the location of the Eski Kordon, it is the area with the most intensive use by urbanites. There are urban areas located in the area that cater to a wide variety and different uses. There are hotels, accommodation areas such as a police house, cafes, buffets, a walking path, a bicycle path, a marina, various hardware elements, a Trova horse statue, and a basketball

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

court on the area. These areas allow users to do various recreational activities. In this context, it is used a lot by urbanites, especially in the summer months. Basketball tournaments, and various folk game shows are held on the field. On the other hand, various concerts and events are held on important days along the lanyard.

d) 	2	1	2	1	1

Figure 9. Eski Kordon basketball court (Original, 2023).

The visual taken for the area of the Eski Kordon basketball court is given in Figure 9. Figure 9a refers to the visuals where the haze effect is 0%, Figure 9b refers to the haze effect is 33%, Figure 9c refers to the haze effect is 66%, and Figure 9d refers to the haze effect is 100%. An evaluation has been made in this context. The visual area given in Figure 9a can look very good (5 points) within the scope of landscape perception criteria (color, form, line, texture and size). The landscape perception of the visual area given in Figure 9b is scored as color, line, texture and dimension may appear (4 points), and form may partially appear (3 points) depending on the percentage of haze effect applied. The landscape perception of the visual area given in Figure 9c is scored as color, line and texture are partially visible (3 points), and form and measure are not visible (2 points) depending on the percentage of haze effect applied. In Figure 9d, the landscape perception of the given visual area is scored as color and line do not appear (2 points), form, texture and size do not appear at all (1 point) depending on the percentage of haze effect applied. The reason why the color and line are perceived more in the 100% haze effect of the area than other criteria within the scope of the evaluations made is that the preferred colors and colors create lines. Burgundy, blue and white colors are the colors that are more intense to be perceived in the user's memory.

Halk Garden

It is located between Ziverbey Street and Mehmet Dec between the north and south sides of Çanakkale City and between İnönü Street and Kayserili Ahmet Paşa Street from the east and west sides. It covers a total area of 34,188 square meters. 25% of the total area is designed as hard floor and 75% as soft floor. Elm (*Ulmus compestris*), red pine (*Pinus brutia*), ash (*Fraxinus excelsior*), cypress (*Cupressus sempervirens*), and ash-leaved maple (*Acer negunda*) were used as the predominant vegetation in the area (Sağlık, 2014). Apart from these plantings, there are various shrub groups and seasonal plants in the area.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

The presence of dense groups of trees in the area creates a canopy for the area. The presence of these canopy areas is preferred because it makes the area cool in summer. Due to its proximity to locations such as the old state hospital, the old cordon, and the pier, it creates a transition area for urbanites other than the recreation area. Various areas such as children's playgrounds, sports equipment, cafe-restaurant, amphitheater, and animal-friendly parks cater to various age groups within the area. These areas allow users to do various recreational activities. The area is one of the areas with the most intensive use in the city due to its location and location in the city center. It is an area that allows urban residents to escape from their concreted life and breathe in green tissue.

Figure 10. Halk Garden Red Tile Semolina walking path

The visual Figure taken for the Halk Garden red tile semolina walking path area is given in Figure 10. Figure 10a refers to the visuals where the haze effect is 0%, Figure 10b haze effect is 33%, Figure 10c haze effect is 66%, and Figure 10d haze effect is 100%. An evaluation has been made in this context. Within the scope of the landscape perception criteria of the visual area given in Figure 10a, the color and texture can look very good (5 points), and the form, line and measure can be seen (4 points). The landscape perception of the visual area given in Figure 10b is scored as color, line and texture may appear (4 points), form and texture may partially appear (3 points) depending on the percentage of haze effect applied. The landscape perception of the visual area given in Figure 10c is scored as color, line and measure are partially visible (3 points), and form and texture are not visible (2 points) depending on the percentage of haze effect applied. In Figure 10d, the landscape perception of the given visual area is scored as color, line and measure do not appear (2 points), form and texture do not appear at all (1 point) depending on the percentage of the applied haze effect. The reason why color, line, and measure are perceived more in the 100% haze effect of the area than other criteria within the scope of the evaluations made is that the preferred colors and colors create lines. The perceived lines, on

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

the other hand, are effective in the measurement degree of the area. Red is a color that is more intense to be detected in the user's memory. At the same time, red and green colors are opposite colors to each other. This also allows it to be perceived more intensely in two colors.

	COLOR	FORM	LINE	TEXTURE	MEASURE
a) 	5	4	5	5	5
b) 	4	4	4	4	4
c) 	3	3	3	2	3
d) 	1	2	2	1	2

Figure 11. Halk Garden Slate Stone walking path

The visual Figure taken for the slate stone walkway area of the Halk Garden is given in Figure 11. Figure 11a refers to the images where the haze effect is 0%, Figure 11b where the haze effect is 33%, Figure 11c where the haze effect is 66%, and Figure 11d where the haze effect is 100%. An evaluation has been made in this context. Within the scope of the landscape perception criteria of the visual area given in Figure 11a, the color, line, texture and size can look very good (5 points), and the form is scored as visible (4 points). The landscape perception of the visual area given in Figure 11b is scored as visible (4 points) depending on the percentage of the applied haze effect. The landscape perception of the visual area given in Figure 11c is scored as color, form, line and measure are partially visible (3 points), texture is not visible (2 points) depending on the percentage of haze effect applied. In Figure 11d, the landscape perception of the given visual area is scored as form, line and measure do not appear (2 points), color and texture do not appear at all (1 point) depending on the percentage of the applied haze effect. The reason why the form, line and dimension are perceived more in the 100% haze effect of the area than other criteria within the scope of the evaluations is related to the material used on the walking path. The form of the slate stone material, the lines it creates and the way it is used in the area have made it more prominent compared to other criteria depending on the harmony of measurement.

4. CONCLUSION and RECOMMENDATIONS

Various atmospheric events occur on Earth. The name of the atmospheric phenomenon formed by various particles suspended above the atmosphere is haze. Due to the formation of haze, it

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

is a weather event that prevents visibility. The low visibility prevents the perception of spaces and spaces for users. With the increase in the amount of haze, visual impact affects the evaluation criteria (color, form, line, texture and size) to different degrees in terms of visibility. Preferred locations within the scope of the study; These are the areas located in the Çanakkale city center where urbanites can do recreational activities and are intensively used by urbanites. A haze effect was added to the field images photographed on-site and their legibility was evaluated with a scoring system within the scope of visual landscape criteria.

If a general assessment of the preferred areas is made;

- Yeni Kordon; both of the preferred positions in the area create the same perception of the haze effect. With the increase of the haze effect, the visibility rate has decreased.
- Sarıçay; Both of the preferred locations in the area create the same perception of the haze effect. With the increase of the haze effect, the visibility rate has decreased.
- Özgürlük Park; Both of the preferred locations in the area create the same perception of the haze effect. With the increase of the haze effect, the visibility rate has decreased.
- Eski Kordon; both of the preferred locations in the area have created different perceptions of the haze effect. The most basic of these differences is the color and line criteria found in the fields. With the increase of the haze effect, the visibility rate has decreased at a certain rate.
- Halk Garden; Both of the preferred locations in the area have created different perceptions of the haze effect. The most basic of these differences is the color, form, and texture criteria. Along with the haze effect, the visibility rate has decreased at a certain rate.

Within the scope of the evaluations, as the amount of haze increased, the visibility of the colors of the ground and reinforcement materials decreased. The visibility of the floor coverings and reinforcement elements selected in light colors is slightly higher in those used with colors that are opposite to the less dark. With the decrease in the visibility of the color criterion, the visibility of the form, line, texture, and measurement criteria also decreases. The color criterion forms the basis of the concept of form and line. Form and line form the basis of texture and measure. When viewed in this context, it can be said that all the criteria are related to each other. In this context, the visibility of users decreases during dense haze and it becomes difficult for them to perceive places.

ABSTRACT

In this study, the aim is to ensure the cultural and social continuity of Yenişehir worker housing, designed to meet the accommodation needs of workers during the establishment of the Karabük Iron and Steel Factory. The objective is to improve the buildings to passive house conditions by following the EnerPHit Standard. To achieve this, the current energy consumption data of worker housing located on the 7th island in Yenişehir neighborhood was determined, and enhancement proposals were made by reinforcing building envelope elements with highly insulating materials. The goal was to transform the housing into a zero-energy building by selecting insulation materials from natural, artificial, and advanced technology categories. Additionally, a cost analysis of the chosen insulation materials was performed to identify the optimal one. As the thermal conductivity coefficient of selected insulation materials decreases, the required thicknesses also decrease. Natural insulation materials have higher thermal conductivity coefficients compared to artificial and advanced technology categories, resulting in thicker layers. On the other hand, advanced technology insulation materials have significantly lower thermal conductivity coefficients, requiring thinner layers. The cost analysis revealed up to 35-fold differences in insulation prices, making cellulose spray, natural insulation, the most cost-effective, and aerogel panels, advanced technology insulation, the most expensive among the examined materials. While the costs of natural and artificial insulation materials are close to each other, it is evident that advanced technology insulation materials are considerably more expensive. This study is expected to serve as a guiding reference for zero-energy building designers, architects, and decision-makers.

Keywords: Zero-energy Building, Improvement, Thermal Insulation Materials, Cost.

1. INTRODUCTION

As a result of technological advancements, population growth, and changing lifestyles worldwide, energy consumption is increasing day by day. The construction sector is recognized as a significant contributor to the total energy consumption. Globally, the construction sector accounts for approximately 36% of total energy consumption (UN Environment and International Energy Agency, 2017). According to the European Commission, buildings are held responsible for about 40% of energy consumption in the European Union (European Commission, 2021).

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

As a solution to the substantial energy consumption attributed to the construction sector worldwide, passive houses are emerging as a prominent option. Passive houses are structures that provide thermal comfort conditions with minimal energy usage. They are designed to integrate with climatic data and are environmentally friendly and energy-efficient buildings (Duran and Kartal, 2021). The Passive House Institute has developed the Passive House Standard for new constructions and the EnerPHit Standard for existing buildings (Aşıkoğlu et al., 2021).

There are five fundamental principles used in the construction of passive houses. These principles include high levels of thermal insulation in the opaque building envelope, design without thermal bridges, an airtight building envelope, high thermal resistance windows and doors, and heat recovery ventilation with high-efficiency features (Passive House Institute, 2023). In passive houses, high-thickness thermal insulation is applied to the building envelope to ensure energy conservation. Thermal insulation materials play a crucial role in reducing energy demand and fuel consumption during the building's usage phase.

In this context, the objectives of the study can be outlined as follows:

- Identifying the existing energy consumption data of the Yenişehir workers' housing.
- Improving the energy consumption of this housing according to the Passive House EnerPHit Standard.
- Conducting a cost analysis of the insulation materials recommended for energy improvement.

In this context, the study encompasses determining the characteristics of the building envelope elements of the Yenişehir workers' housing, simulating this housing to identify its current energy consumption, generating recommendations for improving the workers' housing according to the Passive House EnerPHit Standard, enhancing the building envelope elements with insulation materials in the recommendations to reduce the energy consumption of the buildings, and conducting cost analyses of the insulation materials used in the recommendations.

2. MATERIALS and METHODS

Within the scope of the study, a worker's housing referred to as Type A1, located in the Yenişehir neighborhood of Karabük, has been selected as the research area. Yenişehir neighborhood and the worker's housing units therein hold significant importance for Karabük. With the opening of the Iron and Steel Factory, Karabük began its transformation into an industrial city. In order to address the housing needs of the factory workers, a modern and exemplary neighborhood was established in Yenişehir.

The worker's housing is constructed using a masonry building system. This Type A1 housing unit is created by placing two blocks side by side. The base area for a single block is approximately 70 square meters, resulting in a total base area of approximately 140 square meters for both blocks combined. The housing unit features a plan with dimensions of 13 meters by 14 meters, including protrusions and recesses. The two blocks are designed as exact mirror images of each other. The housing unit is single-story, with a floor height of 3 meters. It has a pitched roof, designed as a cold roof. The unit includes a kitchen, living room, 2 bedrooms, and wet areas. The plan, section, and elevation of the housing unit are provided in Figure 1.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

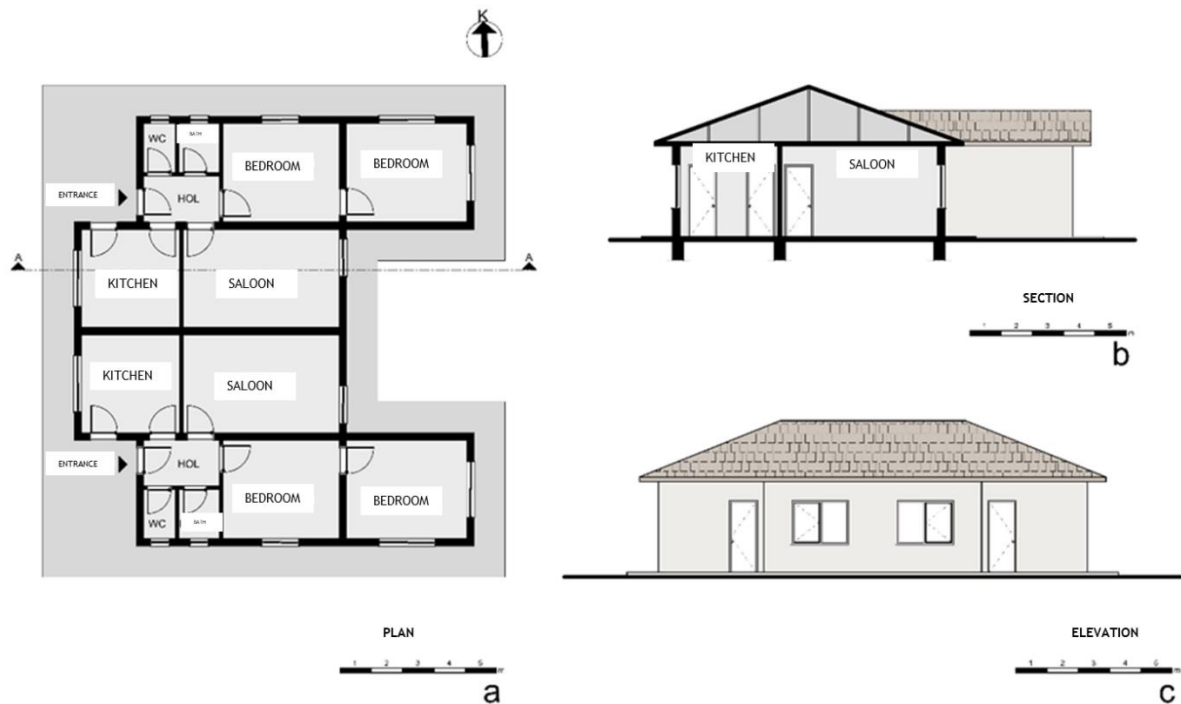

Figure 1. A1 type worker's housing a) plan, b) section, c) elevation (Adapted from Karabük Municipality, 2020).

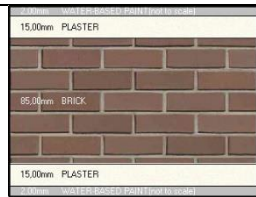

The worker's housing utilizes brick as the wall-filling material. The windows consist of PVC frames and double glazing. Detailed material information for the housing is provided in Table 1.

In the study, the existing energy consumption of the house and the energy consumption of the improvement proposals created within the scope of the EnerPHit Standard were determined through the DesignBuilder simulation program. Elitech RC-51H device was used to measure and record indoor temperature data and verify the outputs calculated by the simulation program.

To determine the current status of the A1 type worker housing in terms of energy consumption, the properties of the elements that make up the building were examined and the energy consumption of the building was determined. First, the material layers of the components that make up the existing building envelope were examined and the heat transmission resistance (R-value) of the building envelope was calculated. Then, the dwelling was modeled in the DesignBuilder program, the required parameters were entered and simulated to determine the current energy consumption. Table 2 shows the thickness, thermal conductivity coefficient and thermal transmission resistance of the building envelope components.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

In order to determine the current energy consumption of Yenişehir worker housing, the housing was modeled in the DesignBuilder simulation program, data was transferred to the program, and simulation was performed by defining the assumptions in the program. The current climate data of Karabük, the city where the worker housing is located, was taken from the NASA POWER database, which was developed by NASA and provides meteorological data, in epw file format. The current climate data received in epw format was defined in the DesignBuilder program. The data entered into the program and the model of the house created in the program are given in Table 3.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Table 2. The existing material layers and thermal resistance (R-value) of the worker housing.

Envelope	Materials	Thickness (m)	Coefficient of Thermal Conductivity (λ) (W/mK)	Heat Transmission Resistance (R) ($\text{m}^2\text{K/W}$)

	Concrete	0.1	1.13	0.09
	$R_{\text{ex}} + R_{\text{int}}$			0.04+0.13
	R_{ground}			0.52 m²K/W
	U_{ground}			1.92 W/m²K

Suggestions have been created for the improvement of Yenisehir worker housing towards the EnerPHit Standard developed by the Passive House Institute for existing buildings. Karabük province, where the worker housing is located, is located in the cold temperate climate zone according to the Passive House climate classification (SEPEV; 2018 translated from iPHA,

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

2018). The criteria required for a building in this climate zone to meet the Passive House EnerPHit Standard are given in Table 4.

Table 3. Data entered into the DesignBuilder program and the model of the dwelling.

Parameters	Properties
Building Function, Number of Users	House, 4 people
Heating-Cooling Set Point Range	18°C - 24°C
Heating Programming	January-February-March-April-May and September-October-November-December
Cooling Programming	June-July-August
Heating and Cooling System	Natural Gas Radiator + Electric Air Conditioner
Unheated-Cooled Units	Wet Areas and Attic
Air Tightness Value	0.7 ac/h

Model

Table 4. EnerPHit criteria for the cold temperate climate zone (modified from Passive House Institute, 2016 translated from SEPEV, 2022).

EnerPHit Criteria for Components	
U Value (Heat Transmission Coefficient)	Opaque Building Envelope $\leq 0.15 \text{ W/m}^2\text{K}$ Exterior Doors and Windows $\leq 0.85 \text{ W/m}^2\text{K}$
Heat Recovery Rate	$\geq 75\%$
EnerPHit Criteria for Energy Demand	
Heating Demand	$\leq 25 \text{ kWh/m}^2 \text{ y1l}$
General EnerPHit Criteria	
Air Tightness	$\leq 1.0 \text{ ac/h}$
Primary Energy Demand	$\leq 120 \text{ kWh/m}^2 \text{ year}$

According to this schedule, buildings must meet the EnerPHit criteria for either the component method or the energy demand method. While it is sufficient to fulfill the criteria of one of these two methods, in addition, the general EnerPHit criteria must be met. In this study, improvement

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

proposals have been developed to fulfill both the component method, the energy method and the general EnerPHit criteria.

It was decided to use more than one thermal insulation material in the recommendations to be created for the improvement of workers' housing for the EnerPHit Standard. Since the other parameters should be the same for all thermal insulation materials, the improvement proposals were divided into two consecutive steps: common and thermal insulation and improvement proposals.

Firstly, the parameters to be used common to all thermal insulation proposals, such as the selection of highly thermally insulated Windows-exterior doors, the selection of a highly efficient heat recovery HVAC system and the air tightness value, were determined. The DesignBuilder program does not give the total U-value of the window. Therefore, the U-value of the window consisting of glass and frame selected in the program was calculated with the equation used by the Passive House Institute to determine the window U-value. The common retrofit parameters were determined as given in Table 5 and the EnerPHit Standard criteria were met for these parameters for the cold temperate climate zone.

Table 5. Joint improvement decisions

Joint Improvement Decisions	
Windows (3 different)	0.71 W/m ² K, 0.74 W/m ² K ve 0.77 W/m ² K 3-pane Argon Filled Low-e Glass, PUR Insulated Frame
Exterior Door	0.73 W/m ² K Insulated Door with PUR
HVAC System	Heat Recovery VRF System Heat Recovery Rate 85
Air Tightness	0.6 ac/h.

After the common improvement recommendations were identified, recommendations for improvement with thermal insulations to increase the heat transmission resistance of opaque building envelope elements were created. In accordance with the EnerPHit Standard, retrofitting with thermal insulations should be carried out in the opaque shell components of the buildings: exterior wall, roof slab and floor slab. In the retrofit recommendations, thermal insulation materials were decided and the thicknesses of these thermal insulation materials that should be in the opaque shell components were determined. Within the scope of this study, the classification of thermal insulation materials in the categories of natural, artificial and advanced technology is discussed. The selected thermal insulation materials and their properties are given in Table 6 and the required thicknesses are given in Table 7.

In the study, a cost analysis of improvement scenarios with thermal insulations was made. The cost analysis was made based on "1m² thermal insulation" used in the exterior wall. The costs of the thermal insulations used in the 1m² exterior wall were determined according to the

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

calculated thicknesses in the improvement proposals. The prices of thermal insulation materials were obtained from the companies according to the dimensions of "1m² x 1cm thickness". The price information of thermal insulation materials in "1m² x 1cm thickness" unit and the companies from which prices were obtained are given in Table 8. The prices of thermal insulations were obtained in May 2023.

Table 6. Selected thermal insulation materials and their properties.

Thermal Insulation Materials	Coefficient of Thermal Conductivity (λ) (W/mK)	Density (kg/m ³)
Natural Thermal Insulation Materials		
Sprayed Cellulose	0.039 W/mK	50 kg/m ³
Artificial Thermal Insulation Material		
EPS Sheet	0.034 W/mK	25 kg/m ³
Advanced Technology Thermal Insulation Material		
Aerogel Sheet	0.015 W/mK	200 kg/m ³

Table 7. Selected thermal insulation materials and thicknesses required for the building envelope.

	Coefficient of Thermal Conductivity (λ) (W/mK)	Ext. Wall (cm)	Roofing (cm)	Ground Floor (cm)
Natural Thermal Insulation Materials				
Sprayed Cellulose	0.039	24.5	24.5	23.5
Artificial Thermal Insulation Material				
EPS Sheet	0.034	21	21	20.5
Advanced Technology Thermal Insulation Material

Aerogel Sheet	45 Euro + % 18 KDV	AMA AEROGEL

3. FINDINGS and DISCUSSION

As a result of the energy simulation of the worker's dwelling, the current heating, cooling and primary energy demand of the dwelling was obtained. The findings for these demands are given in Figure 2.

Figure 2. Current energy consumption of the worker's dwelling.

It can be said that the heating demand of this worker's dwelling, whose energy consumption was determined, is quite high and heating demand constitutes the majority of primary energy demands. The baseline energy performance results show that this dwelling is far from the EnerPHit Standard criteria for the cold temperate climate zone.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

The improvement proposals of the worker's dwelling for the EnerPHit Standard were modeled in the DesignBuilder program, the necessary parameters were defined and energy simulations were carried out. The findings for heating, cooling, and primary energy demands obtained as a result of the simulations of the improvement proposals of the dwelling are given in Table 9.

Table 9. Energy consumption of worker housing retrofit proposals.

	Heating demand (kWh/m ² year)	Cooling demand (kWh/m ² year)	Primary energy demand (kWh/m ² year)
Sprayed Cellulose	22.660	19.612	113.69
EPS Sheet	22.422	19.356	113.13
Aerogel Sheet	21.112	18.663	111

When the findings obtained as a result of the energy simulation of the improvement proposals created with 3 different insulation materials for the worker's dwelling are examined;

- In the improvement proposals compared to the current situation; heating demand decreased by approximately 90%, cooling demand decreased by approximately 45% and primary energy demand decreased by approximately 70%.
- The largest reductions in improvement recommendations compared to the baseline are in heating and primary energy demand, and the smallest in cooling demand, respectively.
- All 3 improvement proposals meet the EnerPHit Standard criteria of 25 kWh/m² for maximum heating demand and 120 kWh/m² for maximum primary energy demand.
- In all 3 proposals, heating, cooling and primary energy demands are close to each other and differ slightly. This situation can be explained by the fact that the insulation thickness sensitivity is taken as 0.5cm and accordingly, the R values are not equal.

Among the improvement suggestions for the EnerPHit Standard, the cost analysis of the thermal insulation materials used in the exterior wall was made. In the cost analysis of thermal insulation materials, the unit was determined as "1m² thermal insulation". Prices were calculated for the required thicknesses (1m² x required thickness) determined in the improvement suggestions. The price information of thermal insulation materials in units of "1m² x required thickness" is given in Figure 3.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Figure 3. Costs of thermal insulations for the unit "1m² x required thickness"

When the prices of thermal insulation materials are analyzed based on "1m² x required thickness";

- Sprayed cellulose, which is natural thermal insulation, is the lowest-priced thermal insulation material with a price of 12.25 Euro + 18% VAT,
- Aerogel board, an advanced technology thermal insulation, is the highest priced thermal insulation material with a price of 427.5 Euro + 18% VAT,
- It is seen that there is a difference of approximately 35 times between the prices of these two thermal insulation materials with the lowest and highest prices.

It can be said that the prices of natural and artificial thermal insulation materials are close to each other for both "1m² x 1cm thickness" and "1m² x required thickness" units, but the price of high-tech thermal insulation materials is considerably higher than natural and artificial thermal insulations. For both units, sprayed cellulose, which is one of the natural thermal insulations, is the lowest-priced insulation material.

4. CONCLUSION and RECOMMENDATIONS

In all of the thermal insulation improvement proposals used in the improvement of Yenişehir workers' housing within the scope of EnerPHit Standard, results in compliance with the EnerPHit Standard were obtained. It has been observed that the insulation thicknesses calculated according to the thermal conductivity coefficients in order to meet the building envelope heat transmission coefficient criterion of the EnerPHit Standard differ up to 2.5 times. While the thickness of natural thermal insulation is quite high, the thickness of artificial thermal insulation is relatively less and the thickness of advanced technology thermal insulation is quite small. While each of the thermal insulations gives very close results in terms of energy performance, it should be taken into consideration that those with high thicknesses may create negative situations in terms of aesthetics, usability and burden on the structure by creating extra thickness in walls and floors.

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

In the cost analysis for cost-effective improvement of houses, it was seen that insulation prices differ up to 35 times. Among the thermal insulations analyzed, it can be said that sprayed cellulose, which is a natural thermal insulation, has the lowest cost and aerogel board, which is an advanced technology thermal insulation, has the highest cost. While the costs of natural and artificial thermal insulations are close to each other, it is possible to say that the cost of advanced technology thermal insulation is quite high.

Thanks and Information Note

This study was supported within the scope of the project numbered KBÜBAP-22-YL-158 of Karabük University Scientific Research Unit.

ABSTRACT

Wood and mass timber panels are susceptible to moisture, which can lead to the growth of fungi and insects, resulting in a decrease in the strength and displacement capacity. CLT (Cross Laminated Timber), is one of the most widely used engineered products in modern timber structures, and connections within CLT structures are made using hold-downs/brackets fixed with metal nails/screws to provide required ductility. Swelling and shrinkage of these panels due to humidity and corrosion of nails/screws may impact the structural performance of both the panels and the system. Handbooks on mass timber structures cover the effects of moisture on the structure and ways to prevent moisture damage, the values relating to moisture content and methods of measuring moisture content are specified in the standards. However, a standardized test method for investigating the relationship between moisture and strength has not yet been defined. There is very limited research on how moisture relates to strength in structural timber. This study aims to investigate the properties and relations between CLT, moisture, and strength by reviewing existing literature. Examining experimental results show that moisture hurts timber and the effect of moisture should be taken into consideration in structures.

Keywords: Cross Laminated Timber (CLT), Moisture, Strength.

1. INTRODUCTION

Wood has been one of the most widely used building materials for centuries due to its high strength, accessibility, and ease of use, but it is an anisotropic and hygroscopic material. It has different properties in different directions and its relationship with water is quite strong, and this causes dimensional changes through swelling and shrinkage (Figure 1). To eliminate the mechanical weaknesses of wood, mass timber panels (MTP) are produced by industrial processing and gluing. These industrial wood products possess high strength, ease of application, and recyclability, in addition to their environmentally friendly and sustainable nature (Ayanleye et al., 2022). CLT, LVL, Glulam, NLT, and DLT are the most used timber composite products. These structural mass timber panels are used as load-bearing walls and flooring in construction and provide desired performance demands e.g., fire resistance, rigidity, and durability. However, like wood, engineered timber products are more vulnerable to moisture than other building materials. Moisture ingress plays a vital role in the degradation, reducing its strength and displacement capacity, and causing fungal/insect growth and

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

biological decay. (Figure 2). Under these circumstances, wood products become less desirable when interacting with water and moisture. Humidity affects density, strength, stiffness, swelling, and shrinkage along with the structure of the wood (Kuklik, 2008).

Figure 1. a) Hygroscopic and anisotropic properties of the wood (Kesik & Martin, 2021; Glass & Zelinka, 2010)

Figure 2. CLT and example of deterioration of CLT flooring under the influence of moisture (Kesik & Martin, 2021)

MTPs are exposed to water and moisture from various sources, from manufacture to transport to site and construction to use. Sources of liquid water such as rain, snow/ice melt, and ground moisture during the construction phase, and leaks in the plumbing system during use are typical sources of wetting. The ends of the panels (end grain, face grain), and gaps between the laminations and grooves at the joints present great wetting risks (Figure 3). Panels absorb water vapor from the in a humid environment, also increasing moisture content. When the wood is no longer absorbing or losing moisture, it reaches equilibrium moisture content with the environment (Wang, 2020). As a result of wetting and moisture, staining, fastener corrosion, mold growth, decay, cracking, and surface checking can occur in mass timber elements (Dunn, 2023) (Figure 4). These may affect building aesthetics, structural capacity, and indoor air quality. (Moisture Risk Management Str., 2022)

September 14-15, 2023, Naples, Italy

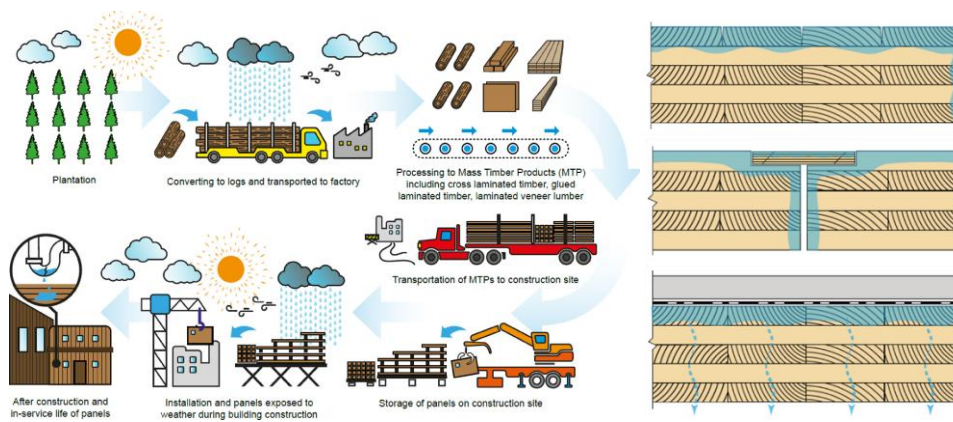

Figure 3. a) Wetting resources (Shirmohammadi, Leggate, & Redman, 2021)
b) Wetting points (Moisture Risk Management Str., 2022)

Figure 4. Moisture effects on mass timber panels. (Moisture Risk Management Str., 2022)
(Dunn, 2023)

Cross Laminated timber (CLT), one of the most preferred industrial timber products in modern timber construction, consists of 3-5-7 layers of wood stacked and glued diagonally at 90 degrees and is used as structural system elements in buildings (Figure 5). CLT panels with high strength have low ductility and the ductility of the connections made with metal plates, nails/screws determine the earthquake resistance of the structure (Figure 6). Swelling and shrinkage of the panels due to moisture and corrosion of metal elements affect the structural system and cause deterioration.

Connections are the most exposed parts during the construction phase and will cause damage if not properly designed to resist moisture (Figure 7-8). The panels have a slow drying time due to their high water absorption capacity. If the panels reach equilibrium moisture content naturally or manually drying methods, the swelling and shrinkage from wetting and drying cycles may cause cracks, resulting in significant damage to the panels.

Figure 8. Damage caused by shrinkage (Encapsulated Mass Timber Const., 2021)

2. MATERIALS and METHODS

To investigate the effect of moisture on the strength of CLT, a review of literature, standards and CLT handbooks were examined. There are varying global standards regarding the moisture content of wood, with specific requirements set for determining moisture content (MC) and optimal equilibrium moisture content conditions. According to TRADA (2019), it is advised that the MC of wood used in construction should not exceed 20%, and according to AWC (2018) and APA/ANSI (2018), under dry service conditions, the MC should be less than 16% and approximately 12% $3 \pm$. Although standards specify MC measurement methods, there is no standard test method for the moisture/strength relationship. When reviewing the CLT manuals, while they provide details such as the interaction of the structure during construction and manual protection methods, there is no direct reference to strength. Therefore, an analysis of strength and moisture was conducted through literature studies.

3. FINDINGS FROM EXPERIMENTS and DISCUSSION

The relationship between moisture and strength in structural timber has not been adequately investigated. Tests have been carried out on samples of various sizes under a range of nails and wetting conditions, allowing us to gather data on the application of wetting and water-impregnation techniques based on field data.

In the study by Kalbe et al. (2022) a laboratory set-up was established to observe the moisture distribution in CLT panels, although the durability was not investigated. CLT specimens were placed in the container to ensure they remained immersed in 1-2 mm of water. The transfer of moisture was observed using blue ink added in water (Figure 9&10).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

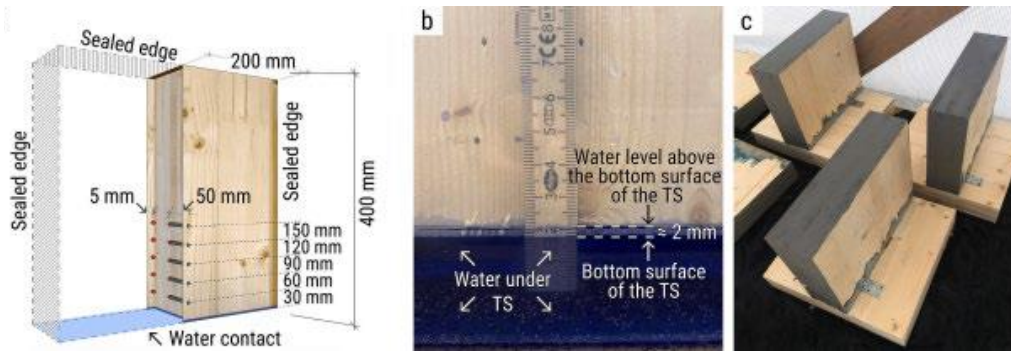

Figure 9. Test setup in the study by (Kalbe et al., 2022)

Figure 10. Water rising in panels (Kalbe et al., 2022)

When analyzing the results, end-grain surfaces of CLT panels are susceptible to wetting effects and need to be protected.

Rammer and Winistorfer (2001) conducted a study on the impact of moisture on dowel-bearing strength. Samples were split into two groups: in the first group, Southern Pine specimens were subjected to bolt tests at five different moisture levels (4%, 6%, 12%, 19%, and natural moisture content), in the second group, Southern Pine, Douglas Fir, Spruce-Pine-Fir specimens submitted to flat nail tests at 6% and 20% moisture content.

There is a marked increase in dowel-bearing strength as moisture content (MC) decreases. This correlation remains consistent across multiple types of wood and connection elements (Figure 11).

Figure 11. Dowel-bearing strength relation with MC (Rammer & Winistorfer, 2001)

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Ringhofer et al. (2014) investigated the impact of varying moisture content on the withdrawal strength of screws on solid wood and laminated wood (CLT) specimens produced from Norway spruce. The solid wood samples were tested in both the grain and perpendicular the grain directions and samples were exposed 8% 12% and 18% MC and nail withdrawal strength was determined at these moisture levels (Figure 12).

Figure 12. Test setup in the study by (Ringhofer et al., 2014)

Analysis of the results shows that withdrawal strength decreases with increasing MC, especially above %12 moisture content, in both solid and laminated wood samples (Figure 13).

Figure 13. Graphs were prepared based on the results of the study by Ringhofer et al., 2014.

In the first of two similar research, Bora et al. studied the effect of short-term rain on CLT angle brackets. The specimens were sprinkled at an average of 10°C and average relative humidity (RH) of 80%, and dried specimens were returned to pre-test conditions of 10°C and 40% RH (12 ±3%). Following this, they carried out cyclic loading tests on the samples and measured the effects of the humidity (Figure 14).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 14. Test setup in the study by (Bora, Sinha & Barbosa, 2022)

In the second study conducted by Bora et al., wetting, and drying tests were performed on connections using identical samples. This study aimed to investigate the exposure as a wetting method.

The findings reveal that separate studies with different soaking cycles and methods using the same specimens are similar. The load-bearing capacity of the wet specimens increased compared to the control specimens. The flat nails used in the experiments caused this effect by swelling. The result of the experimental setup using straight nails is controversial. Additionally, wetting and redrying resulted in a statistically significant decrease in total energy dissipation capacity of the connections (Figure 15).

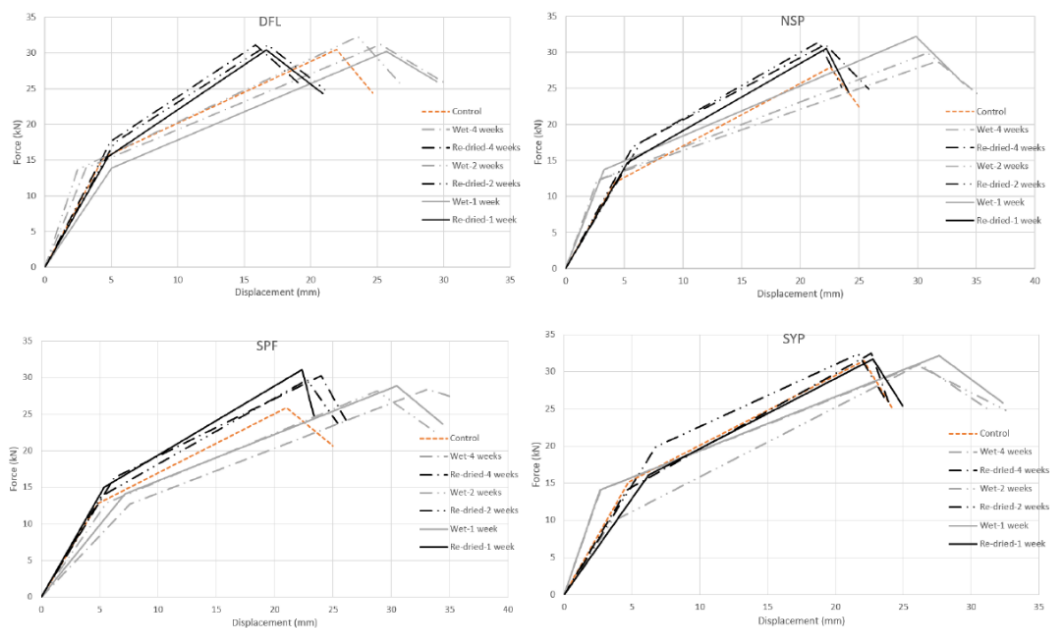

Figure 15. Average ASCE 41-17 trilinear curves of different exposure conditions of the samples prepared data taken from the research by Bora, Sinha & Barbosa, 2021.

The potential corrosion of metal nails and screws typically used in connections with changes in MC is another factor to consider when examining the relationship between moisture and strength.

Yerman et al. (2021) explored the impact of repetitive exposure to moisture on the strength and corrosion of nails in wood. The study used plain and galvanized nails in tests on pine samples.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

The specimens were soaked until they reached 50-60% MC and dried 10-15%MC. Samples underwent 1, 3, 5, and 8 cycles of wetting and drying, followed by conducting withdrawal tests.

After one cycle, there was a decrease followed by an increase after three cycles, and then a steady decrease (Figure 16). Plain nails experienced a more marked decrease than electro-galvanized nails. It is emphasized that using galvanized fasteners in wet conditions is crucial.

Figure 16. Test results from the study by (Yerman et al., 2021)

4. CONCLUSION and RECOMMENDATIONS

- Moisture ingress can cause decay and microbial growth, impacting the durability of CLT.
- Changes in moisture content within wood can cause changes in dimensions and stress in connections.
- The strength-moisture content relationship is not dependent on species or connection type.
- The effect of moisture hurts the energy dissipation capacity of connections.
- The moisture content of wood has a significant effect on the pull-out resistance of self-tapping screws.
- The moisture content of wood elements markedly affects the withdrawal of screws, especially if the moisture level exceeds 12%.
- Galvanized nails represent higher withdrawal capacity than plain nails.
- The connection elements used in the tests should be preferred to give accurate results.

The effect of moisture on the strength is obvious but should be investigated in more detail and a standard strength/moisture relationship test method should be determined. By knowing the effect of moisture on strength and connections, precautions such as producing CLT construction details designed against moisture, preventing loss of strength, and vulnerability to moisture can be proposed.

ABSTRACT

Over the past few years, the Southeastern Black Sea Region of Turkey has undergone extensive coastal reclamation, resulting in the loss of its natural coastlines. This study aims to assess public perceptions of coastal reclamation practices in the coastal development process of the region. To achieve this objective, a set of questionnaires utilizing a five-level Likert scale was conducted to gauge public opinion regarding coastal development in the region. A total of 432 individuals participated in the survey, with the majority stating that they possessed a moderate to very well understanding of the region's coasts and had been living in the region for over 20 years, thereby witnessing the coastal reclamation process firsthand. The survey results indicated that participants held a negative attitude towards coastal reclamation preferences. In contrast, participants showed positive attitudes toward preserving non-artificial coasts for sustainable coastal natural preservation. In addition, participants agreed that public opinion should be considered in coastal management planning in the region. The reliability analysis of the questionnaire yielded favorable results. The findings of this study suggest that the most common coastal reclamation practices implemented by the local authorities fail to meet public demand. This study underscores the importance of considering ecological and socio-economic aspects in terms of sustainable coastal development.

Keywords: Coastal Area, Coastal Management, Coastal Reclamation, Public Perception, Black Sea.

1. INTRODUCTION

Coastal areas are invaluable regions that provide humanity with resources and vital ecological functions (Barbier et al., 2011; Lakshmi, 2021). These areas, characterized by their unique blend of land and sea, play a pivotal role in sustaining life on our planet. Coastal regions provide benefits for coastal communities ranging from fisheries that feed millions to the recreation and relaxation they provide (Pascoe et al., 2023). The coastal region is also the epicenter of intense anthropogenic activities (Abdelfattah et al., 2023). The dense human population, coupled with industries, tourism, and urbanization, places enormous pressure on these fragile ecosystems (Burak et al., 2004; Zhu et al., 2023). Balancing the utilization of coastal resources with their preservation is a complex challenge that requires sustainable and responsible management to ensure that these vital regions continue to thrive for future generations (Bremer et al., 2022).

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

However, human activities in coastal areas have led to coastal ecological and socio-economic degradation, with adverse consequences for both the environment and local communities (Mishra et al., 2021). These detrimental actions, including pollution, overfishing, urban development, and industrial activities, have disrupted the balance of coastal ecosystems (Andrews et al., 2021). As a result, a decline in biodiversity, the loss of critical habitats, and the deterioration of water quality, all of which have far-reaching impacts on the health of oceans and the well-being of coastal communities (Slingenberg et al., 2009). Furthermore, the socioeconomic consequences of these activities are obvious, as coastal populations bear the weight of environmental deterioration. The degradation of coastal ecosystems directly impacts livelihoods, with many dependent on fisheries and tourism seeing declines in income and opportunities (Becken, 2016). Additionally, the vulnerability of these areas to extreme weather events is heightened due to ecosystem degradation, putting lives and property at risk (Lotze et al., 2006; Nichols et al., 2019). For decades, the Black Sea has borne the brunt of numerous detrimental anthropogenic activities that have taken a toll on its delicate ecosystem. These relentless pressures include eutrophication, stemming from excessive nutrient runoff, overfishing that has depleted marine populations, pollution from industrial and urban sources, and the devastating impacts of wars in the region (Altın et al., 2009; Stanev & Ricker, 2019; Ulman et al., 2020). Moreover, the relentless encroachment of land reclamation projects has further altered the coastal landscape, exacerbating the Black Sea's ecological issues (Güneroğlu, 2015). The cumulative effects of these activities have resulted in a profound and long-lasting degradation of this once-thriving body of water. Over the past few decades, the Southeastern Black Sea region has undergone extensive coastal reclamation, resulting in the loss of its natural shorelines (Erüz & Ismail, 2015; Ismail, 2016). Coastal reclamation is a widespread practice in coastal development around the world (AlQahtany et al., 2022; W. Chen et al., 2017). However, these practices often fall short of achieving their main objective, which is to promote human welfare, due to the subsequent ecological degradation (Hossain et al., 2018; Yu et al., 2017). This degradation leads to the loss of social and economic well-being for communities. The relentless progression of coastal development and extensive reclamation projects has engendered a complex web of conflicts surrounding coastal land uses (Hu et al., 2018; Wang et al., 2021). Conflicts over opposing interests escalate as urban growth and infrastructural expansion continue to encroach on coastlines. These conflicts encompass a range of issues, from disputes over limited space for residential and commercial purposes to ecological concerns stemming from habitat destruction and environmental degradation (Y. Chen et al., 2019; Ma et al., 2019; Yu et al., 2017). Addressing these multifaceted conflicts necessitates comprehensive planning, effective governance, and sustainable practices that strike a delicate balance between accommodating the needs of growing populations and safeguarding the fragile coastal ecosystems that are vital to our planet's health and well-being. This study aims to assess public perceptions of coastal reclamation practices in the coastal development of the Southeastern Black Sea Region of Turkey.

The primary objective is to gauge public preferences between natural and artificial coastal environments and to gain insights into public perceptions concerning the ongoing, and often long-term, coastal reclamation practices within the context of regional coastal development. This comprehensive assessment aims to shed light on how the community values the balance between preserving the natural state of coastal areas and embracing man-made alterations and also seeks to understand the public's perspectives on coastal management in the region.

2. MATERIALS and METHODS

Characteristic of the study area

The study area is situated within the Trabzon Province, in the Southeast Black Sea region of Turkey. With a population of approximately 818,023 people as of 2022, according to data from the Turkish Statistical Institute (TÜİK), Trabzon is a dynamic region where the majority (89%) of its residents reside and derive numerous benefits from the region's narrow coastal area and the riverbanks (TÜİK, 2022). This unique blend of natural beauty and human habitation makes Trabzon a fascinating area for study and exploration. Most of Trabzon Province's coastal area has undergone long-term coastal reclamation (Güneroğlu, 2015; Ismail, 2016).

Figure 1. Location of study

Survey methods

Perceptions of people of Trabzon were collected through a public survey. Attention was paid to the fact that the participants of the survey were especially those who benefit from the coastal area and sea in Trabzon also its surroundings. Most participants reside in the Trabzon coastal area (10 districts). To achieve this objective, a series of questionnaires were conducted to gauge public opinion on the topic. The questionnaires utilized a five-point Likert scale: (1 – *Strongly disagree*, 2 – *Disagree*, 3 – *Neutral*, 4 – *Agree*, 5 – *Strongly disagree*).

Data analysis

The questionnaire's reliability was established through a meticulous assessment of its internal consistency using Cronbach's Alpha, demonstrating its trustworthiness as a research instrument. The reliability analysis of the questionnaire yielded favorable results ($\alpha \geq 0.8$). Furthermore, data obtained from the survey underwent rigorous statistical analysis, including the Kolmogorov-Smirnov and Shapiro-Wilk tests, revealing that the data did not conform to a normal distribution. Given this characteristic, a Non-parametric One-Sample Wilcoxon test was

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

employed to examine the extent of public consensus on matters related to coastal development and reclamation in the region. All statistical analysis was conducted using the software package SPSS (George & Mallery, 2010).

3. FINDINGS and DISCUSSION

In this study, public perception regarding coastal reclamation practices within the context of coastal area development in the Southeast Black Sea Region of Türkiye has been conducted through a public survey. A total of 432 individuals from Trabzon province participated in the designated survey. The majority of respondents resided in Ortahisar district (Trabzon center) accounting for 62.7% of the total sample, followed by participants from Akçaabat district (20.8%) and Yomra district (4.9%). The remaining respondents (11.6%) were drawn from other coastal towns (districts) within Trabzon Province and areas outside of Trabzon (Figure 2). Ortahisar district (Trabzon center), Akçaabat district, and Yomra district are not only among the most populous districts in Trabzon Province but have also experienced ongoing coastal reclamation as part of coastal development initiatives in recent years (Güneroğlu, 2015; Hamzaoglu & Dihkan, 2023; Ismail, 2016).

Figure 2. Survey participant's origin (based on the district in Trabzon)

In order to assess public perception regarding coastal reclamation practice in terms of coastal development in the region, we conducted a survey that focused on the duration of respondents' residence in Trabzon Province. The results revealed that a significant majority of survey participants had resided in Trabzon Province for more than two decades, accounting for 78.2% of the total respondents. Additionally, 12% of participants had been living in the province for 10 to 19 years, while 4.9% had resided there for 5 to 9 years. The remaining 4.9% of participants had been in Trabzon Province for less than 5 years. Participants' period of live in Trabzon is shown in Figure 3. The majority of survey participants stated that they had been living in the region for over 20 years, thereby witnessing the coastal reclamation process firsthand. The coastal reclamation process in Trabzon dates back to the 1950's and intensified during the 2000's (Ismail, 2016).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 3. Periods of live in Trabzon

To assess participants' knowledge regarding coastal areas and coastal reclamation/development process in the region, the knowledge of participants was surveyed. The results indicate that only a small number of survey participants expressed very little confidence, with 0.7% ($n = 3$) stating they were "very unconfident," and 3% ($n = 13$) indicating they were "unconfident" regarding their knowledge about the coastal area and coastal reclamation processes in the region. While the majority of participants exhibited a more positive level of knowledge. Specifically, 37.7% ($n = 163$) considered their understanding to be at a "medium/neutral" level, while 33.6% ($n = 145$) reported a "good/confident" level of knowledge. Furthermore, 25% ($n = 108$) of respondents expressed a high degree of confidence, describing their understanding as "very good/confident" regarding the local coastal area and coastal reclamation/development processes. The survey participants' level of knowledge regarding coastal area and coastal reclamation/development process in the region is shown in Figure 4.

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

Figure 4. Level of knowledge regarding Trabzon's coastal condition

In this study, public perception of cornering coastal reclamation practice within the context of coastal development in the region was assessed based on participants' attitudes regarding the practices tested using the designated survey. The survey outcomes revealed consistently high mean values in response to the statements that were tested. These elevated mean values reflect the collective perspective of surveyed individuals highlighting the significance of their views regarding coastal reclamation practices in the region. The mean values of statements are shown in Figure 5. The level of agreement on testes surveyed is shown in Figure 6.

Figure 5. Mean level of participation

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 6. Level of agreement on the statements

The finding derived from a one-sample Wilcoxon signed-rank test unveiled a significant difference in medians, with a Z-score of 15.43 and a $p < 0.01$. This outcome reflects a robust effect size ($r = 0.74$), indicating a substantial magnitude of the observed effect. This outcome suggests that a substantial majority of Trabzon's residents, exceeding 60% of the surveyed population do not support the idea of coastal reclamation or artificial coastal area development. Instead, they have a preference for the preservation of natural coastal areas which signals a prevailing sentiment against these practices in the region. The findings of this study suggest that the prevailing coastal reclamation practices adopted by authorities often fail short of meeting public expectations of preserving natural coastal areas for sustainable coastal area management. This research underscores the importance of considering socio-economic aspects in the concept of sustainable coastal development. The result of this study is several studies conducted in the region. The allure of the old, natural coasts is rooted in the diverse range of beach activities they offer, as highlighted by Alpak et al. (2016). Despite the improved accessibility that new artificial coastlines provide for transportation purposes, the local populace continues to favor the original, natural shores due to the richness of recreational opportunities available. While the initial goal of creating new artificial coasts was to establish social areas, such as parks and sports facilities for the community, research by (Özdemir Işık & Demirel, 2016) indicates that these spaces are primarily limited to seaside activities. Historical remote sensing data and field studies conducted by Güneroğlu (2015) and Ismail (2016) reveal that the reclaimed areas have been utilized for a wide array of social and commercial purposes, including roads, parks, sidewalks, harbors, and seaports. Unfortunately, despite these transformations, the ecosystem services provided by Trabzon's coastal areas have been gradually deteriorating, as observed by Aktürk & Güneroğlu (2021). This highlights the need for a comprehensive approach to coastal management that not only considers the desires of the local population but also prioritizes the preservation and restoration of coastal ecosystems to ensure their long-term health and sustainability.

4. CONCLUSION and RECOMMENDATIONS

To understand the sentiments regarding coastal development and reclamation in the Southeast Black Sea region of Turkey, a comprehensive public opinion survey was conducted through a public survey. The participants in this survey were individuals who have resided in Trabzon for more than two decades, thereby witnessing the transformation of the once-pristine, natural coastal areas into new, man-made, reclaimed coastal areas along the Trabzon Province. The findings from this survey revealed a striking preference among Trabzon residents, with more than half expressing a strong inclination towards preserving the charm of the original, natural coastlines compared to the newly created artificial and reclaimed coastal areas. This sentiment highlights the deep-rooted connection between the local population and their natural surroundings, underlining the significance of these coastal landscapes to their cultural and environmental heritage. It is clear that while coastal development in the region initially aimed to provide additional social spaces for the local community, a significant portion of the population does not endorse the conversion of the natural coastlines into artificial or reclaimed coastal areas for such purposes. These survey results underscore the importance of sustainable coastal planning and management, where the preservation of natural beauty and ecosystem integrity is carefully balanced with the desire for social and economic development. Based on the principles outlined in the Coastal Law and the recognition that coastal areas are considered common property, it is essential to align coastal management practices with the true intent of serving the public interest and welfare. Based on this outcome, several recommendations can be made to promote sustainable coastal management as follows:

- **Preserve natural coastline:** Sustainable coastal management should focus on protecting the charm and ecological integrity of natural coastlines.
- **Ecosystem conservation:** Sustainable management practices should protect and restore these vital natural resources.
- **Balance development:** Careful planning should ensure that new developments are harmonious with the existing environment.
- **Community engagement:** Locals deep-rooted connection to the coastal landscapes should be acknowledged, and their input should be considered in planning and management.
- **Environmental Impact Assessment (EIA):** EIAs should evaluate potential ecological consequences and consider alternative, less invasive approaches.
- **Integrated Marine Spatial Planning:** Implement integrated coastal management plans that consider ecological, social, and economic factors.
- **Public awareness and education:** Raise awareness among the local population about the importance of sustainable coastal management.

Thanks and Information Note

We would like to thank to Trabzon residents who took the survey.

ABSTRACT

This study aims to investigate the impact of human activities, particularly building construction, on beach litter pollution. In this regard, a construction site and coastal areas in the Southeast Black Sea Region of Turkey were selected as the pilot study locations. All anthropogenic litter categorized as macro litter (≥ 2.5 cm) was collected. The collected litter subsequently classified into nine litter groups based on materials (plastic, metal, glass, paper, cloth, wood, rubber, sanitary and medical waste as litter associated with COVID-19). Litter density was calculated to assess the extent of litter pollution in the study area. A total of 1585 litter items were sampled from the construction sites, yielding an average litter density of 2.7 litter items/m². In addition, 730 beach litter items were collected from the beaches, with an average litter density of 1.6 litter items/m². Plastic materials dominated the litter composition in both locations. Foam and hard plastic litter which are frequently used in construction buildings, were widely encountered in significant numbers in both locations. Moreover, a substantial amount of single-use litter items, including plastic bottles, plastic bags, cigarette butts, and beverage containers, emerged as the most abundant litter types in the study areas. These findings underscore the impact of construction waste on marine litter pollution, with the easy transportability of lightweight materials exacerbating the problem. Implementing eco-friendly materials and sustainable construction practices is essential to mitigate the pollution caused by building construction-associated activities.

1. INTRODUCTION

Coastal regions and riverbanks rank prominently among the most coveted locales for human settlements and are frequently targeted for ambitious construction and development projects for several purposes. These projects include the development of residential communities, public amenities, and the establishment of industrial and commercial zones (Hawa et al., 2023; Yang et al., 2022). The picturesque settings along coasts and riverbanks offer a unique combination of natural beauty and accessibility, making them attractive choices for a variety of development projects (Kurochkina, 2020). Moreover, the accessibility of coastal areas and riverbanks is an invaluable asset for economic, recreational, and logistic purposes. Proximity to waterways facilitates efficient transportation and trade, fostering economic growth and the exchange of goods and ideas in the region (Bax et al., 2022).

The process of construction and building development indicates the transformation of natural landscapes into artificial landscapes (Izakovičová et al., 2021; Simensen, 2018). This transformation is often accomplished through the construction of man-made structures and infrastructure to accommodate the needs and demands of an expanding population as well as a varied range of economic activities (Yu et al., 2017). However, extensive construction and development projects inevitably result in an environmental concern: the substantial accumulation of solid waste within the construction perimeters (Rahman & Esa, 2014). This issue is exacerbated by the widespread use of construction materials that are neither environmentally friendly nor easily recyclable. These materials frequently comprise non-recyclable metals, paper, plastics, and other non-sustainable components, thus magnifying the ecological impacts left by construction activities (Noor et al., 2020).

Significant volumes of solid waste are generated during the construction of buildings. The construction process generates a wide variety of waste, including leftover building materials, demolition debris, packaging materials, and other discarded items (Coşkun & Öztürk, 2012; Kılıç, 2012). Managing and disposing of these solid wastes can pose significant challenges due to their sheer size and weight (Sharma et al., 2020). Thus, it becomes crucial to handle them properly and adopt responsible waste management practices are essential to minimize the environmental impact of construction activities and promote sustainable building practices. Implementing effective recycling and waste reduction measures can play a vital role in alleviating the burden of these weighty and voluminous waste materials on landfills, thereby contributing to a more environmentally conscious construction industry (Wan et al., 2019).

The presence of these waste materials poses a substantial and concerning threat to both the ecological balance of the natural environment and the overall health and safety of human communities (Ankit et al., 2021; Iroegbu et al., 2021). As a result, various proactive measures and comprehensive policies have been put in place to effectively curb the generation of construction waste. These efforts have led to a significant reduction in the associated damage and environmental impact of such waste (Tafesse et al., 2022). Numerous proactive measures and comprehensive policies have been put in place to effectively curb the generation of construction waste, resulting in a significant reduction in their associated damages and environmental impact (Arslan et al., 2012). A study on comparison of such disposal or recycling methods in China shows that greenhouse gas emissions from traditional landfill usage for construction wastes are much higher than recycling of the materials (Liu et al., 2020). Nonetheless, enforcing penalties for non-compliance may encounter multiple challenges,

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

prompting an alternative approach that focuses on raising awareness within the sector about the importance of environmental preservation (Kinzig et al., 2013). By cultivating a culture of responsibility and sustainability, the industry can be inspired to adopt voluntary and proactive measures to protect the environment and foster an eco-friendlier approach to construction practices (Yu et al., 2021).

The “Urban Transformation Law” approved by The Ministry of Environment and Urbanization-Department of Waste Management of Turkey, aims to address the issue of structural waste in Turkey. The goal is to significantly reduce the annual production of 45 million tons of structural waste to 10 million tons within the initial three years of its implementation. According to the report presented by the Waste Management Presidency of the Ministry of Environment and Urbanization, this ambitious reduction in structural waste production is expected to be achieved through the effective enforcement of the Urban Transformation Law. As a result, approximately 6 million tons of material will be directed towards recycling efforts (Kılıç, 2012). The significance of this endeavor extends beyond the architectural discipline, as it involves safeguarding the environment, promoting public well-being, and contributing to the overall economy. Recognizing the potential threats posed by structural wastes, the authorities aim to prioritize environmental preservation, public health, and economic sustainability in their waste management strategies (Tafesse et al., 2022).

This study attempts to investigate and conduct a study of the influence of human activities, with a particular focus on construction projects, on the issue of marine litter pollution. The objective of this study is to assess the variety and quantity of solid waste in a specific area, with a parallel aim of enhancing the awareness and sensitivity among architecture students who will play pivotal roles as future decision-makers, designers, and professionals within the construction industry.

2. MATERIALS and METHODS

Study area

To investigate the impact of construction waste and beach marine litter, a construction site in Arhavi and beaches in Sürmene both situated in the Southeast Black Sea Region of Türkiye were selected as pilot study locations. Location of the study area is shown in Figure 7.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 7. Map of the study area

A field investigation was conducted, specifically targeting areas that were currently undergoing construction activities in Arhavi town. In order to compare construction waste and beach marine litter, samples of beach marine litter were collected from coastal areas in Sürmene town. Coastal areas in Sürmene town were selected as comparisons in this study based on the accountability data and long-term monitoring of beach marine litter which dates back to 2009 (Erüz et al., 2023; Terzi et al., 2020).

In addition, the field study of beach marine litter collection was part of raising public awareness regarding marine litter pollution conducted in both locations in the Southeast Black Sea Region of Türkiye (EU, CBS, BSB-785 LitOUTer Project). This field study was participated by the Art and Design Faculty of Artvin Çoruh University and the Marine Science Faculty of Karadeniz Technical University.

Beach litter collection

In this study, all human-generated litter found within the designated 100-150 square meters transect areas at both sites was collected. The focus of this investigation was on macro litter, and thus, natural debris like seaweed, animal bones, and untreated wood were not included in the litter collection process. By the OSPAR classification system (Aytan et al., 2019; Terzi et al., 2020; Terzi & Seyhan, 2017; Wenneker et al., 2010), the collected litter was categorized into nine primary categories and 42 subcategories, which encompass plastic, rubber, fabric, wood, paper, metal, glass, sanitary waste, and medical waste. In addition, the items associated with the COVID-19 pandemic were classified under the categories of sanitary and medical waste, which included single-use face masks, gloves, wet wipes, bottles for liquid hand sanitizers, packaging for soap, and alcohol-based cologne. To estimate the litter density in terms of quantity (number), the collected items were counted. Sample of construction-related waste in the study area is shown in **Error! Reference source not found.**

Data analysis

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

In this study, an assessment was carried out to evaluate the level of litter pollution in the study area. This assessment focused on analyzing the litter's composition, distribution, and density in both sites. To ascertain the litter composition, the percentages of each litter category were calculated relative to the total amount of collected litter. The measurement was expressed as the number of items per square meter (items/m²) (Özşeker et al., 2022; Terzi et al., 2020; Terzi & Seyhan, 2017). For the calculation of litter density, the provided equation (Eq. 1) was employed.

$$D = N/(w * l) \quad (1)$$

The litter density (D) was determined by considering the total number of litter items gathered from the transect (N), the width of the transect (w), and the length of the transect (l), all measured in meters.

Figure 8. Construction-related collected litter on the beaches: hard plastics (PVC pipes and electronic appliances and single-use packages of construction materials)

3. FINDINGS and DISCUSSION

During the Summer of 2022, a comprehensive sampling and collection process was undertaken to collect solid waste from both construction sites and selected coastal areas in the Southeast Black Sea Region of Türkiye. All non-natural litter found along predefined transects was identified and documented to facilitate the subsequent litter categorization process. The collected litter was classified into nine major categories and 42 subcategories according to the OSPAR classification system (Wenneker et al., 2010). Following the categorization procedure, the entire collection of litter from both sites was properly disposed of in garbage containers. This was an essential step in reducing solid waste pollution and protecting the environment. Moreover, this action is part of an effort to raise awareness regarding construction waste pollution and its impact to the environment among architecture students of Artvin Çoruh University and Marine Science Faculty of Karadeniz Technical University actively involved in this study.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

The findings of this investigation revealed that a total of 1585 litter were collected from construction sites while 730 beach marine litter items were collected from the beach sites. The analysis further highlighted plastic materials constituted the most prevalent type of litter, comprising a significant majority of the litter composition at both study sites when evaluated based on item count (number). Following plastic, paper, and metal emerged as the second and third most prominent collected litter in both locations. The litter composition at construction sites was as follows: plastics accounted for 35%, paper for 26%, metals for 24%, cloth for 6%, glass for 4%, wood for 4%, and COVID-19-associated waste for 1% (Figure 9 left). While beach litter composition as follows: plastics accounted for 73%, paper for 20%, metals for 2%, glass for 1%, COVID-19 associated waste (medical and sanitary waste) for 3%, cloth for 1%, (Figure 9 right).

Figure 9. Litter composition from construction sites (left) and beaches (right)

The majority of anthropogenic litter collected from construction sites consisted primarily of plastic, paper, metal, and plastic-mixed materials. These results are in line with the litter collected from coastal areas was predominantly composed of plastic, paper, metal, and plastic-mixed materials. The widespread use of plastics, papers, and metals, which are commonly used in construction either as building materials such as pipes, (styro) foams, cable, etc., or in the packaging of building materials for example faucet furniture or other building materials packaging contributes to their prevalence as construction-related litter. The twenty most common litter in construction sites are shown in Figure 10,

This composition is largely influenced by the significant presence of single-use plastic (SUPs) packaging and items, which contribute significantly to the high amounts of plastics and paper in the litter. These materials, often used for packaging various products and for disposable items, are unfortunately prevalent in coastal litter due to their widespread usage and improper

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

disposal practices (Fogt Jacobsen et al., 2022). The substantial presence of plastic materials in this area strongly implies that plastic litter may have accumulated or been transported on sites, possibly carried by run-off, winds, rain, and currents, traveling quite a distance from its initial source before entering the marine environment (Jambeck et al., 2015).

Figure 10. Litter density of most commonly found litter in the construction site

Materials such as plastic, paper, and metal, which are commonly found in single-use plastic (SUP) packaging, food and beverage containers, and similar items, have a noteworthy characteristic—they are lightweight and easily transported from one location to another (Geyer et al., 2017; van Emmerik et al., 2022). Once introduced into the environment, these materials tend to accumulate in marine ecosystems, including beaches, water columns, sediments, and marine organisms. This phenomenon has been well-documented in studies like the one conducted by Bergmann et al. (2015), highlighting the persistence of these materials in marine environments and their potential ecological impacts. This finding indicates a relatively limited level of awareness among people, resulting in litter entering the stream. The collected beach litter is shown in Figure 11. Plastics have gained worldwide recognition as one of the most commonly used and extensively produced materials in the modern era, serving a wide range of purposes. They are extensively employed in packaging, especially for beverages and drinks, which are frequently moved from one location to another. Plastic possesses characteristics such as slow degradation in natural environments and lightweight nature, which make them highly convenient for transportation and contribute to its widespread accumulation. As a result, plastics have become the most prevalent waste material both in terms of quantity and quality.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Despite their widespread presence, their abundance often goes unnoticed due to their lightweight properties (Barnes et al., 2009; Beaumont et al., 2019; Castro-Jiménez et al., 2019).

Figure 11. Litter density of most commonly found litter in the coastal sites

The findings shed light on the inadequate waste minimization practices at the construction site, evident in the lack of regular storage for organic debris and solid waste in designated areas, as well as the improper handling of recyclable materials. Consequently, there is a pressing need for architects and engineers, who hold influential roles in decision-making and play active roles in project construction and implementation within the construction sector, to be sensitized to this matter early on, starting from their years as students. They should be encouraged to inquire and proactively seek solutions to key issues, such as "how to reduce waste production," "how to implement effective recycling measures," and "how to minimize the environmental and economic impacts" associated with construction processes. This proactive approach can pave the way for more sustainable and responsible construction practices in the future (Nodehi et al., 2022; Purchase et al., 2022; Yu et al., 2021). While the Regulation on Control of Excavation, Construction, and Demolition Wastes emphasizes the importance of selective demolition, it lacks provisions for recycling and demolition planning (Buzkan & Erman, 2020). Given the oversight of considering the diversity and density of construction waste, there is an urgent call for legal regulations that promote environmental awareness and recycling (Rahman & Esa, 2014; Tafesse et al., 2022).

In an attempt to reduce the usage of disposable plastic bags, Turkey introduced regulations in 2019 that required charges for plastic bags (Çevre ve Şehircilik Bakanlığı, 2019; Dursun, 2020). Similar measures implemented in various parts of the world have yielded promising outcomes,

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

resulting in a significant decrease of up to 85% in plastic bag consumption (Cabrera et al., 2021). Nonetheless, despite these regulations, the cost of plastic bags in Turkey remains relatively low, and some merchants continue to distribute them free of charge. This practice could undermine the intended purpose of the regulations and potentially encourage unrestrained and excessive use of plastic bags. Consequently, the persistent issue of plastic waste in the country may worsen due to the continued availability and affordability of single-use plastic bags. To achieve the desired reduction in plastic bag usage and effectively address the plastic waste problem, it will be essential to enforce these regulations more rigorously and educate consumers about the significance of decreasing plastic consumption while adopting reusable alternatives.

These findings underscore the pivotal role of human activities in the accumulation of waste and emphasize the need for heightened awareness and responsible waste management practices among users. They shed light on the pressing requirement to combat overconsumption and improper disposal of single-use plastic products to mitigate the increasing problem of marine litter and protecting the environment. Effectively addressing construction waste and marine litter issues necessitates collaborative efforts from local communities, authorities, and stakeholders to promote sustainable behaviors and reduce dependence on disposable plastic items. The implementation of efficient waste management strategies and the dissemination of awareness regarding the environmental repercussions of beach litter pollution are critical in preserving the clean coastal environment of the Southeast Black Sea region for future generations. By raising awareness and enforcing responsible waste management practices, we can combat beach marine litter pollution and contribute to the long-term ecological well-being and sustainability of the region's coastal areas.

This research is poised to make a substantial contribution to the existing literature, particularly due to the limited number of studies available on the types and quantities of solid waste in construction areas. Furthermore, it is expected to serve as a valuable reference for future investigations into the separation of recoverable pollutants at their source and the promotion of public awareness regarding pollutants and prevention methods, underlining the concept that the environment is a collective responsibility. Additionally, the ongoing support for environmentally friendly construction and zero-waste projects within the framework of the 11th Development Plan aligns with and reinforces the objectives of these studies. It is anticipated that this research will provide a solid foundation for more comprehensive investigations in this field.

4. CONCLUSION and RECOMMENDATIONS

The findings of the study revealed an extensive array of solid waste materials generated from the construction activities, and their quantities were found to be quite substantial within the surveyed area. The findings underscore the significance of responsible waste management practices during construction projects to address the environmental impact and ensure sustainable development in the region. The research findings also revealed a lack of systematic storage for construction solid waste and inadequate mechanisms for recycling reusable materials, leading to the accumulation of waste. Local authorities were observed to have shortcomings in managing waste collection within construction zones, failing to provide essential services. Moreover, despite the legal requirement for inspecting excavation waste from existing structures, there appears to be a deficiency in enforcing this obligation.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Construction building activities produce a substantial volume of solid waste, with a significant portion of these materials ultimately finding their way into the marine environment, where they accumulate in different parts of the ocean. In light of this situation, the need for innovative and transformative solutions becomes increasingly evident. It is imperative to adopt radical measures aimed at mitigating environmental impacts and transitioning towards the use of eco-friendly construction materials, thereby promoting sustainable development practices. These include:

- Raising awareness among administrators and decision makers and increasing the deterrence of penalties in the laws,
- Architects and engineers, who are project designers, make system design and material selection by considering the amount of waste that may occur in their designs,
- The implementing architects, engineers, or construction site officials should develop solutions to prevent or reuse the wastes generated during the construction phase, implement practices to ensure their recycling,
- In cooperation with local authorities, construction waste is collected, sorted, and recycled into the economy. For example, metals can be recycled, while small pieces of wood can be reused or incinerated.

In addition, through this study conducted in the designated region of Arhavi district within Artvin Province, students majoring in the relevant field gained a heightened awareness regarding the diversity and volume of construction waste. It was evident that the students engaged in fieldwork displayed sensitivity toward the issue.

Thanks and Information Note

We would like to thank the Artvin Çoruh University and Karadeniz Technical University students who actively engaged in the awareness-raising activity concerning building construction waste and beach marine litter collection in the designated study area.

ABSTRACT

In recent years, 3D printers have been used in many industries such as film, television, and advertising. Particularly in the film industry, the use of 3D printers has made the designs of fictional settings, costumes, and characters in movie scenes much more detailed and realistic. Furthermore, the time and repeatability capabilities offered by 3D printers have allowed designers to create complex objects that were previously not possible. These innovations have expanded the boundaries of designers and enabled the realization of designs that were previously impossible. This study focuses on the place and future of 3D printers in the film industry and how they have affected and will affect the design value of fictional setting design. While 3D printers can produce not only simple designs but also more difficult and complex objects, the time and repeatability capabilities offered by 3D printers affect the design and its limitations. Some traditional methods are abandoned due to the innovations brought by the industry, which changes the development and formation of design. The products offered by 3D printers, which are an industrial product, are primarily visual perception objects that reveal the relationship between volume, mass, and structure within a certain space and in a certain form. This study aims to demonstrate the design value of the products offered by 3D printers in fictional cinema settings within the context of the developing Industry 4.0 technology through literature research.

Keywords: Industry 4.0, 3D Printers, Fictional Space, Design.

1. INTRODUCTION

This study examines how 3D printing has redefined design processes and investigates the potential impacts of this technology on the future of society. 3D printers expand the boundaries of design, offering new possibilities in artistic expression and production. Particularly, the film industry is one of the areas that benefit most from the innovations brought by this technology. 3D printers have caused a redefinition of design processes and boundaries by providing designers the opportunity to create complex objects that were unimaginable before. This has facilitated the emergence of detailed, realistic, and extraordinary designs in sectors like cinema, television, and advertising. Additionally, the repeatability and speed brought by 3D printer technology have led to revolutionary changes in the world of design. This technological breakthrough, replacing traditional methods, has accelerated the evolution of design and

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

emerged as a part of Industry 4.0. In this study, the changes created in the realm of 3D printing have been examined, and how 3D printing may play a role in societal transformation in the vision of Society 5.0 has been investigated concerning its potential impacts.

Industry, Industry 4.0

Industry, in general, represents a broad economic sector that processes raw materials into manufactured goods and services. Historically, the industry has undergone several major evolutions, and each evolution has led to significant changes in production methodologies, business models, and the economy. Industry 4.0 represents the fourth evolution of the industry and is often referred to as the "Fourth Industrial Revolution."

According to the definition by the Turkish Language Association, industry is expressed through the following sentences by Necati Cumalı: "A novel is a commodity pushed into consumption by the press industry." As can be understood from here, the object to be used, in terms of its position, space, and time, holds value and meaning within the concept of industry. While a novel can be classified as a work of art or literary work in terms of content, it bears the quality of a commodity when evaluated for consumption within the press industry.

Throughout history in the industry, three main revolutions have occurred, namely mechanization, mass production, and digitization. The first industrial revolution (Industry 1.0) triggered a change in production by enabling mechanization through the discovery of water and steam power. Before this revolution, production was almost entirely dependent on human power, but post-revolution, machines began to form the foundation of production. The spread of electricity usage sparked the second industrial revolution (Industry 2.0). Machines that emerged and became widespread during the first industrial revolution gained the ability to operate with electrical energy in the second industrial revolution. Thus, the concept of mass production replaced the old production methods imbued with art and craftsmanship. With mass production, a large number of products can be produced in a much shorter time compared to before. The third industrial revolution (Industry 3.0) occurred with the inclusion of electronic systems and information technologies in production. Along with this revolution, new generation machines and equipment have been developed, and automation has gained importance in production. The fourth industrial revolution, also known as Industry 4.0, has entered our lives along with concepts like robotics, 3D (three-dimensional) printers, advancements in nanotechnologies, and the Internet of Things (IoT). 3D printers are of vital importance for Industry 4.0 due to their potential. It has become possible to produce parts that could not be produced with traditional manufacturing methods using 3D printers, and devices conducive to digital production, which traditional manufacturing equipment cannot possess, have been developed (Yuran & Yavuz, 2021). The occurrences of mechanization, mass production, and digitization have shaped the design process, developing different production possibilities in design through CAD systems and different design production techniques. This has facilitated the development and shaping of every area where design is implemented.

3D Printer and Design Possibilities

Industry 4.0, as the fourth evolution of the industry, represents an era dominated by interconnected systems that automate production processes and are equipped with technologies like machine learning and artificial intelligence. Within this evolution, 3D printers also hold a key role. And 3D printers are far beyond printing technology.

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

3D Printers (3B), as sub-components of the Industry 4.0 process, epitomize the point technology has reached. Allowing for the production of a desired product or form in three dimensions, 3D printers have spread to cover nearly all sectors today. Particularly in the manufacturing sector, various new expansions are taking place in the Industry 4.0 process. In this regard, 3D printers possess numerous advantages such as increased speed in production, reduced costs, and minimized pre-production risks (Mayda, 2019).

The concept of constructing a structure using robotic technologies and minimal human labor was known as a distant idea until recently. The applicability of three-dimensional printers required high costs and was quite expensive. This idea has now lost its validity; on the contrary, today, the construction of architectural structures using three-dimensional printers is emerging as cheap, economical, and environmentally friendly (Tümer, 2020). Its impact on costs has further solidified its place in the industry, taking its place within evolving systems. These processes are transforming the nature of trade, allowing for new models to emerge in the producer-consumer balance (Mayda, 2019).

In its simplest form, a three-dimensional printer is a device that enables the conversion of data stored in a computer environment into physical real objects. This technology, at the same time, is capable of producing geometries that cannot be obtained with traditional manufacturing methods (Şahin, Turan 2018). This situation further expands the design boundaries.

Three-dimensional printers are devices capable of producing models that have been modeled on a computer or scanned in three dimensions at a much faster rate compared to traditional manufacturing methods (Fındık & Taşdemir, 2020). 3D printers deviate from traditional manufacturing methods by allowing the printing of high-resolution organic structures. While having each layer of the design in different geometry is an undesirable situation in traditional manufacturing methods, it becomes a feature enabling production in 3D printer technologies. "The Terra Stool" structure, designed by Marco Mattia Cristofori, has been produced as a single piece, without needing any additional support material, and with angles not exceeding 60 degrees, taking into account bionic design principles. In linear designs, right angles pose a problem in accommodating the applied load, while the ability of 3D technology to allow curved angles is a significant feature that will facilitate its faster inclusion among the production technologies of the future (Canbolat & Aydın, 2019). Being produced as a single piece and allowing curved angles enable the use of 3D printers in many areas.

The technology of 3D printing has undergone significant evolution over recent years through two main structures, namely prototyping and production distribution. The three-dimensional outputs provided by this technology are utilized across many disciplines including engineering, architectural design, industrial design, automotive, aerospace, military applications, and the healthcare industry (Balcıoğlu, 2014). Architectural design is one of these disciplines and a deep interaction is observed when the contribution of 3D printing technology to this field is examined. Architectural design processes have become faster, more flexible, and innovative with the contributions of 3D printing technology. 3D printers provide designers with the opportunity to create prototypes quickly and test these prototypes. This facilitates the identification of errors in the initial stages of design and, when necessary, easy modification of the design. Thus, it becomes possible to progress the design process in a more efficient and error-free manner. On the other hand, the use of 3D printers for fictional cinema spaces allows for these spaces to be designed in a more realistic and detailed manner. In the cinema industry,

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

especially in science fiction and fantasy films, detailed models and set pieces produced with 3D printers offer a more immersive experience to the audience. The design value of architectural design and fictional cinema spaces within the industry has increased with the contributions of 3D printing technology. This technology allows for architectural designs to become more functional and aesthetic, as well as for the creation of more realistic and impressive spaces in the cinema industry. Therefore, the value added by 3D printing technology to these fields is increasing both aesthetically and functionally. When going through a production and design process with a 3D printer, what becomes the design value of spatial design within the fictional cinema industry?

3d Printers and Fictional Cinema Spaces

The use of 3D printers in creating fictional cinema spaces has brought a new perspective to the film industry. With traditional methods, creating detailed set designs and accessories is both time-consuming and costly. However, the technological advancements brought by 3D printers have made these processes faster, more flexible, and cost-effective.

One of the main principles of Industry 4.0, "real-time" production, manifests itself in fictional cinema spaces through 3D printing technology as well. A set piece that is damaged or missing during filming can be reprinted quickly, which shortens the production time of the film and reduces costs. Furthermore, personalization and customization, another significant feature of Industry 4.0, have become possible in fictional cinema spaces with 3D printing. Special designs or customized set pieces that conform to the requirements of a period can be easily produced thanks to 3D printers. (URL-4, 2022). In conclusion, the use of 3D printers in creating fictional cinema spaces is an excellent example of how the technological innovations provided by Industry 4.0 have been integrated into the film industry. This integration offers a higher level of customization, flexibility, and efficiency in set design and accessory production.

Table 2: Comparison of Modern and Traditional Methods (created by authors)

	Spaces Produced with Traditional Design Method	Spaces Designed with Three-Dimensional Printers
Design Process	The design team creates designs on paper. Initial sketches and concepts are formed.	The design team creates a detailed model using computer-aided design (CAD) software. This model is directly readable by the three-dimensional printer.
Level of Detail	Designs created using traditional methods can be limited in terms of details. Especially for complex structures, manually processing these details can be time-consuming.	3D printers can easily produce complex details. This allows the design to be more realistic and detailed.
Production Time	After the design is completed, the construction process begins. Workers need to cut, assemble, and paint the materials. This process can take months.	3D printers can rapidly produce a physical model of the design. The production time may be limited to days or weeks.

 University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

Iterations	With traditional methods, modifying Design changes can be easily made with or correcting the design can be three-dimensional printers. Reprinting or challenging. Mistakes or design correcting a part can be quick and cost-effective. changes can be costly and time-consuming.
------------	---

As in all design models, the source in industrial design is humans; more precisely, it is the concept that is a thinking entity of humans. It is the materialization of the design concept in an object. There is no intrinsic difference among these empirical objects we call design entities. The difference emerges in their value entity. This value entity is based on its ontological structure. (Tunalı, 2009).

2. METHOD

This study delves into how the technology of 3D printers, emerging as a product of Industry 4.0, could facilitate a more comprehensive understanding of the transition to Industry 5.0. 3D printers symbolize the convergence of technological and societal innovations, making them a central component of Industry 5.0. Industry 5.0 emphasizes collaboration between humans and machines; hence, a significant role is anticipated for 3D printers in this era.

3. FINDINGS and DISCUSSION

The aim of Industry 5.0 is to integrate the technological innovations brought about by Industry 4.0 in the most efficient manner, striving to create a human-centered society.

Society 5.0 provides guidance for adapting to the digital transformation era and the fourth industrial revolution on both individual and societal levels. In a study prepared by the Japan Business Federation Keidanren, the objectives of Society 5.0 include;

- Bringing together the virtual world and the real world,
- Benefiting from the Internet of Things while considering the interests of society. (URL-1, 2023)

In the scope of Industry 4.0 and Industry 5.0, we can examine fictional cinema spaces in light of the described aspects.

We can say that the movie Avatar is a milestone in the 3D output stage. With Avatar, the concept of 3D output created has now become one of the indispensable equipment of movies. Throughout the movie Avatar, 3D output has been done many times. The most striking of these are the models made for spaces. (Balcioglu, 2014)

Table 3: Avatar Film, Comparing the Design Value of Fictional Cinema Spaces in the Context of Industry 4.0 and Industry 5.0 (created by authors)

INDUSTRY 4.0

Technological Revolution	Optimization and Efficiency
--------------------------	-----------------------------

"Avatar" emerged in the cinema industry as a result Thanks to 3-dimensional outputs, the scenes in the of technological advancement and digitization. The film were designed, tested, and implemented more film showcased the potential of cyber-physical quickly and efficiently. systems, real-time data analysis, and automation in

TeMALab

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

the art of cinema. 3-dimensional outputs were used in creating prototypes of spaces in the film, enriching the details, and designing the physical existences of characters.

INDUSTRY 5.0

Convergence of Art and Technology	Social Values
"Avatar" showcases how technology can integrate with art and create societal impact. The film merges technological advancement with storytelling and visual arts.	The 3-dimensional output experience offered by "Avatar" provided the audience an opportunity to reflect on the relationship between nature, sustainability, and humanity. This is in line with Society 5.0's goal of enhancing societal values and quality of life

Gilles-Alexandre Deschaud, a 3D designer and filmmaker, is known for his short film "Chase Me," in which all characters and accessories are 3D printed. To create the entire universe of this short film, 2500 pieces were 3D printed. Film producer Gilles-Alexandre Deschaud spent 2 years 3D printing all the necessary parts for this film. The reason for using 3D printing is to make all the parts suitable for the atmosphere of the film. Therefore, he was able to independently design 3D objects and the entire universe of "Chase Me" (Url-2, 2023). Allowing him to independently design eliminated the limitations in terms of the layout of the fictional space to be created.

Table 4: Chase me Film, Comparing the Design Value of Fictional Cinema Spaces in the Context of Industry 4.0 and Industry 5.0 (created by authors)

INDUSTRY 4.0

Digitalization and Automation in Manufacturing	Flexibility and Personalization
The use of 3D printing in Gilles-Alexandre Deschaud's film "Chase Me" epitomizes the concepts of digitalization and automation in Industry 4.0. The producer, by embracing 3D printing technology instead of traditional filmmaking methods, digitized the production process and, as a result, achieved both time and cost savings.	3D printing offers the advantages of flexibility and personalization in the production of specially designed parts for the film. Making such detailed and customized production through traditional methods is both time-consuming and costly.

INDUSTRY 5.0

Integration of Technology and Creativity	Empowering Individual Talents and Entrepreneurship
The film "Chase Me" demonstrates how technology can come together with artistic creativity. This film example concretely illustrates how technology in Society 5.0 can support and empower individual creativity.	As stated in the film, Deschaud independently designed all the 3D objects and the film universe. This represents an individual's ability to independently realize large projects thanks to access to technological tools. Society 5.0 aims to create a structure that encourages individual abilities and entrepreneurship

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

Award-winning and highly popular films such as Avatar, Iron Man, Star Wars: The Force Awakens, and Black Panther have utilized 3D printing for designing scenes, sets, various components, and more (URL-3, 2022).

Table 5: Iron man, Star wars etc., Comparing the Design Value of Fictional Cinema Spaces in the Context of Industry 4.0 and Industry 5.0 (created by authors)

INDUSTRY 4.0

Flexible Production	Rapid Innovation
3D printing opens the door to customized production, allowing for the rapid and effective manufacturing of custom parts or accessories for a film.	3D printing accelerates the prototyping process, enabling filmmakers to bring their creative ideas to life more quickly.

INDUSTRY 5.0

Sustainability and Efficiency	Personalized Solutions
Society 5.0 emphasizes the more efficient use of resources. 3D printing supports this principle by minimizing material waste.	Society 5.0 places an emphasis on providing solutions that align with individuals' needs and expectations. 3D printing facilitates meeting this need by making it easier to add personalized details to characters, scenes, or objects in films

In the world of cinema, 3D printing first enables the creation of prototypes or the printing of several different versions, allowing for comparison. This provides greater flexibility. If a piece breaks during shooting, it can be quickly reprinted. Additionally, with a simple change, a piece can be designed for an actor without them trying it on first; there is no need to adjust it based on their dimensions before production. Since some 3D printers are relatively easy to transport, production can be done on-site, avoiding long and costly scene deliveries (Url-3, 2023).

It demonstrates how Industry 5.0 highlights the importance of collaboration between humans and machines. While 3D printing serves as a tool that helps filmmakers turn their dreams into reality, computer graphics allow humans to express their creativity and imagination limitlessly. This shows that technology is not just a tool but also an extension of creativity and imagination.

4. CONCLUSION

In conclusion, the concepts of Industry 4.0 and Society 5.0 have a significant impact on the world of cinema, both in terms of production processes and content. The role of 3D printing in the design value of mass production goes beyond individuality or mere industrial production. Its place in the context of production creates a holistic meaning and value within the accepted societal framework of fictional cinema spaces, characters, narratives, settings, and many design elements. It forms a design value within a societal framework rather than individuality, as it is based on a shared appreciation within society.

This is because, as Tunali (2009) expressed, in all design models, including industrial design, the primary resource is humanity, or more precisely, the conceptual existence of human thought.

ABSTRACT

Education is a process of gaining knowledge, skills, attitudes, values, responsibilities, and habits in terms of cognitive, social, affective, and physical aspects for the individual and society, self-realization of the individual, creating unique learning structures, analytical thinking, and transformation into action and awareness raising. Education is a fundamental human right and an indispensable tool for the realization of other human rights. It also requires the provision of quality basic education services to every individual. In addition to being the places where education will be received and information transfer will be provided, school spaces provide the opportunity to raise self-confident, intellectual, and right-thinking individuals who are culturally and physically adequately equipped, who are effective in the development of students' identity and personality and the progress of their social and cultural relations. It also plays an important role in improving the quality of education and creating added value. The physical environment and conditions of the school are among the most important factors that have a multifaceted effect on the students and service providers. Today, school spaces are shaped and implemented within the framework of existing legal regulations (especially the Ministry of National Education Minimum Design Standards Guide for Educational Buildings issued in 2015). In today's process, especially the association of issues such as the pandemic, food crisis, climate change adaptation process, carbon footprint, technology, and digitalism with school spaces requires to be addressed in the dimension of discourse and action. In this study, the legal dimensions of school spaces affiliated with the Ministry of National Education are discussed current problems are discussed and suggestions are made to adapt to today's conditions.

Keywords: School Spaces, MNE, Legislation, Landscape Spaces, School Gardens.

1. INTRODUCTION

Education is all the work that aims to develop a person's mind, body, emotional and social abilities, and behaviors in the desired direction or to provide him/her with new abilities, behaviors, and knowledge for certain purposes (Kol, 2003).

The realization of both the right to education and other human rights through education requires the provision of qualified basic education services to every individual. The learning environment, environment, learning areas, and their infrastructure, materials, and technology are important in educating students qualified in every aspect. Today considering that the level

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

of civilization of a nation is measured by the educational opportunities provided to the children of that nation, the value given to their children, and the effort spent to make children social beings, child education has a very important place (Havayıoğlu, 2001).

Primary and secondary education is responsible for ensuring that the child receives a good education, acquires basic knowledge, skills, behaviors, and habits, and is prepared for life and higher education in line with his interests, abilities, and talents. The purpose of primary and secondary education; The aim is to ensure that the child becomes a useful and productive participant in society, as the personality structure that begins to form at this age generally develops in the same direction in the following years, and to provide the child with the quality of a safe social individual. Achieving the goals of education is possible with an educational structure designed appropriately according to the child's physiological and psychological characteristics.

Schools are places that allow students to thrive, provide a sense of community, and encourage collaboration. The society created by the school is a complex structure consisting of human relations, study plans, programs, and daily activities. The physical environment of the school deeply affects whether students like being at school, the quality of teaching, and learning outcomes (Aydoğan, 2012).

The Ministry of National Education has undertaken the responsibility of programming school building requests at the country level, preparing standards by conducting numerical needs analysis, and determining the investment amount. In this study, the applied legal and administrative structures were revealed and the spatial situations of the schools were evaluated.

2. Legal Aspect of School Spaces

The condition of school spaces covers the conditions required for an optimal learning environment. Children's development is a dynamic process, so learning environments must be designed to meet the changing and differentiated needs of the child and support their versatile development with various stimuli. When we look at the education system of the Ministry of Education in terms of spatial needs, it is seen that various areas should be created within the space to enable the necessary activities for the development of children.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

3. FINDINGS and DISCUSSION

3.1. School Location Selection

Various provisions regarding school location selection are included in the seventh Chapter of the Primary Education and Training Law, titled 'Land and Land Affairs of Schools'.

Article 61; "It is taken into consideration that school buildings are in a convenient location in terms of health, education, and transportation.

Public places such as taverns, coffee houses, coffeehouses, bars, electronic game centers, and places where alcoholic beverages are sold must be at least 100 meters from school buildings, door to door. It is stated that during the periods when schools in regions where tourism is intense are on holiday, the 100-meter distance requirement between the above-mentioned workplaces and schools is not required.

In the 5th article titled 'Mandatory Distance' of the regulation regarding the determination of the distances between public places and drinking places and public or private educational institutions;

"There must be a distance of at least 100 meters from door to door between public places, drinking places, and school buildings." A provision similar to the one in the Primary Education and Training Law is included.

In paragraph 'a' of Article 41 of the second Chapter of the Directive on Standards for Private Educational Institutions, reference is made to the Primary Education and Training Law regarding school location and selection. In addition to the referenced article of law; Clause b states that school lands should not be adjacent to state roads, main roads of cities and towns, and commercial roads.

A similar definition has been introduced in TSE for school location selection; unlike the current legal legislation, the distance between school buildings and various public places is specified as 200 meters.

3.2. Building Structure and Features

In 2010, the Ministry of National Education initiated a study to update educational buildings with the publication titled "General Principles of Architectural Project Preparation of Educational Buildings". Later, the study in question was developed and published under the name "*Educational Buildings Minimum Design Standards Guide*" to guide the design of new educational facilities planned to be built in 2013 and 2015. This guide aims to determine design criteria for educational buildings and prevent problems from the past from being transferred to the future (Çelik, 2019).

The Educational Buildings Minimum Design Standards Guide, prepared by the Construction and Real Estate Department of the Ministry of National Education, has been developed to explain the standards that must be followed in projects and to guide planning. It is stated that during the project design phase of all educational buildings planned for new construction, additional buildings, or renovations, the needed programs prepared by the Ministry of National Education, all relevant regulations in force, other current legislation of the Ministry of Environment and Urbanization and the Minimum Design Standards Guide for Educational Buildings must be complied with.

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Educational Buildings Minimum Design Standards Guide, the location selection criteria for the area where the educational building will be built are as follows;

- Educational buildings are close to residential units,
- Compliance with the distances specified in the "Spatial Plans Construction Regulation" prepared by the Ministry of Environment, Urbanization and Climate Change, (According to the regulation, the distance to kindergarten and primary school functions is planned as approximately 500 meters, taking into account the pedestrian accessible distance. This distance is decided by taking into account the characteristics of that region, such as topography, construction status, and existing texture).

The guide ensures that new educational structures to be built meet every need and create suitable educational environments for students and instructors.

In 2010, the Ministry of National Education initiated a study to update educational buildings with the publication titled "General Principles of Architectural Project Preparation of Educational Buildings". Later, the study in question was developed and published under the name "Educational Buildings Minimum Design Standards Guide" to guide the design of new educational facilities planned to be built in 2013 and 2015.

The guide ensures that new educational structures to be built meet every need and create suitable educational environments for students and instructors.

Security

Structural safety of the school building is one of the minimum health and safety requirements in a school. Security studies in and around schools are very important to improve and contribute to a positive atmosphere in the school environment. Ensuring physical security in schools is one of the effective elements of school security.

In the Primary Education and Training Law No. 222, it is stated that "School buildings should be located in a convenient location in terms of health, education and transportation. Public places such as taverns, coffee houses, coffeehouses, bars, electronic game centers, and places where alcoholic beverages are sold must be at least 100 meters from school buildings, door to door.

According to the provisions of the "Regulation on Fire Protection of Buildings", measures for the protection of school buildings must be taken by the school administration.

Building safety is also important, especially in terms of precautions to be taken against earthquakes. In the section devoted to education in the Eleventh Development Plan, the following policies or measures regarding the structural safety of school buildings are included:

- Educational buildings will be designed in an architecture that is compatible with technology and the environment, is safe, economical, aesthetic, accessible, and has high standards and quality.
- Standards of the physical infrastructure of learning environments, curriculum and material richness, self-care skills, integration practices, and guidance services will be increased.

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Target 5.2 of the Ministry of National Education 2019-2023 Strategic Plan, "A justice-based approach model in education will be developed that does not isolate individuals with special education needs from their peers and strengthens the culture of living together."⁵⁴ The items included in the strategies prepared for the target:

- Physical facilities of schools and institutions will be improved, especially for the use of individuals in need of special education.
- Physical facilities of schools and institutions will be improved in line with needs through minor repair and equipment services.

The entrances of the building should be designed and constructed in a way that does not create a security problem, taking into account the environmental conditions. Access to school buildings should be from as few points as possible, making it easier to ensure security and facilitate control and supervision.

The fences surrounding the school and defining its perimeter should be arranged in a way that the school cannot be easily seen or observed from the outside and that it is not possible to climb (Ministry of National Education Educational Buildings Minimum Design Guide, 2015). There should be gathering areas in the school garden after natural disasters and emergencies. Gathering areas should be designed to be easily accessible to individuals with disabilities. If there are stairs at the entrance of the school building, there must be a ramp for the disabled, and the ramp must have features that comply with TS 9111 standards. It is important for the safety of students to have anti-slip tapes on each stair tread. The floors of playgrounds in the school garden should be designed using soft materials, and these materials should be suitable for wheelchair use.

There should be tactile floor applications to enable visually impaired students to move independently within the school and to facilitate access to the sections in the garden. There should be no height difference on the garden floor, a ramp should be designed where there is a height difference and the design of the ramps should comply with TS 12576.

Pedestrian paths and sidewalks should be connected with ramps, and the design of the ramps should comply with TS 12576. Manhole covers designed to remove surface water on pedestrian paths should be placed in a way that does not endanger the safety of pedestrians and individuals with special needs. Materials such as signs, boards, poles, and railings should not be placed on pavements and pedestrian paths, as they will reduce mobility and pose a danger. Underpasses or overpasses by TS 9111 should be constructed on the highways with heavy traffic around the school. Speed bumps should be placed at school entrances and exit openings to the street (Ministry of National Education Educational Buildings Minimum Design Guide, 2015).

Lighting

It is of great importance to provide visual comfort conditions in educational buildings where visual activities such as reading and writing predominate. In educational buildings, where most of the users are students in the developmental age, the necessary visual comfort conditions must be provided to protect the eye health of the students, increase their visual performance, keep their learning performance at a high level, and ensure that they are psychologically satisfied with their environment (Çelik, 2019).

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

In the current standard titled TS EN 12464-1: Light and Lighting - Lighting of Workplaces - Part 1: Indoor Workspaces, the minimum values that must be provided in terms of lighting according to different functions in educational buildings are specified.

Through this standard, the necessary information regarding the quantity (brightness level) and quality (glare, light color, light distribution, etc.) of the light to be created in the classrooms, as well as the interior surface materials and equipment, can be accessed.

Sound and Acoustics

Sound level in schools is one of the important factors affecting the school climate. Some studies reveal the relationship of noise with both learning outcomes and students' psychological well-being. Noise exceeding acceptable limits causes students' reading performance and success in tasks requiring mental concentration to decrease, and ongoing noise increases anxiety and stress levels.

According to the Regulation on the Protection of Buildings Against Noise, published in the Official Gazette No. 30082 on 31 May 2017 and entered into force on 31 May 2018, schools are considered "very sensitive areas to noise".

However, there is no Ministry of Education regulation regulating the regular measurement and reporting of noise and acoustic levels in schools.

In the Regulation on the Protection of Buildings Against Noise, it is stated that the lowest acceptable upper limit of Class C acoustic performance for educational facilities is 39 dB. The regulation states that the ideal indoor noise level measurement is 39 dB for classrooms and 49 dB for circulation areas.

Cleaning and Hygiene

The quality of cleanliness and hygiene conditions in schools is a matter of debate within the education system.

To encourage formal and non-formal education institutions affiliated with the Ministry of National Education regarding cleanliness and hygiene, a White Flag Cooperation Protocol was signed between the Ministry of National Education and the Ministry of Health on 3 August 2006.

The expired protocol was signed again on 10.11.2010 and 05.06.2015 and put into practice. Applicant schools are inspected according to the criteria determined within the scope of the protocol, and among the inspected schools, schools that score 90 or more out of 100 points are given a "Certificate", "White Flag" and "Brass Plate", which is valid for three years and symbolizes school health and cleanliness.

Work and operations related to the white flag secretariat and certificate issuance in governorships are carried out by the Provincial Directorate of National Education, and the supply of white flags and brass plates is carried out by the Provincial Health Directorate (URL, 1).

In addition, in 2020, the Improving Hygiene Conditions and Infection Prevention Control Guide in Educational Institutions was created and it was announced that schools that meet the conditions specified in the guide will be entitled to receive the My School is Clean certificate.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

3.3. Outdoor Features

Outdoor spaces of educational institutions are considered an extension of the education provided in indoor spaces. It is important that educational institutions provide children with opportunities to interact with nature in outdoor spaces, play and engage in activities in the open air, and include regular and sufficient activities in these areas in the program, both for the healthy development of children and for them to become individuals who love nature and strive to protect nature.

Children gain concrete experiences by living more and more in their natural environments through their senses. Therefore, when planning these areas, they should be considered not only as playing areas but also as areas where the child will feel happy and free, where he can have different experiences and make discoveries. Outdoor arrangements should be made in line with the abilities, interests, and needs of the children in the age group served by the program.

School gardens provide opportunities for students to socialize during break times; They are places with an important pedagogical value that create playing and learning opportunities for students through the facilities they contain, such as parks, sports fields, and ecological gardens.

The fact that school gardens are important requires improving the quality of school buildings, taking into account the areas outside the building and making arrangements in the garden.

In the practices carried out by the Planned Areas Zoning Regulation (2017), education areas and arrangements are general, covering all cities throughout the country. However, since the geographical and social structure of each city may not be the same, the regulations cannot be implemented as they should in every city or the desired arrangements cannot be seen in school gardens.

It is difficult to apply certain standards for the gardens of schools in different cities and districts but to provide some basic features in school gardens, the characteristics and standards of school gardens are included in the laws, the guides, circulars, and directives published by the Ministry of Education and other ministry units. These;

Ministry of National Education Primary Education and Training Law No. 222 (O.G. No. 10705 on 12.01.1961) states that "Article 64: There is a practice garden adjacent to or near each village school, not less than 2 decares and not more than 10 decares."

Spatial Plans Construction Regulation (O.G. No. 2903 of 14.06.2014).

"Article 12 (2) In zoning plans; "Children's playground, playground, open neighborhood sports area, family health center, nursery, kindergarten and primary school functions can be planned in the service impact area that needs to be reached on foot, taking into account the distance of approximately 500 meters, secondary schools approximately 1,000 meters, and high schools approximately 2,500 meters."

Accessibility standards for disabled people have been announced in the Planned Areas Zoning Regulation (O.G. No. 30113 of 03.07.2017).

Law No. 5378 on Disabled People (O.G. No. 25868 of 01.07.2005) explains the access of disabled people to areas.

Ministry of National Education Secondary Education Institutions Regulation (O.G. No. 29871 of 28.10.2016);

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

It is stated as "Article 95: School buildings, facilities, and gardens are arranged by the accessibility requirements of disabled individuals".

Ministry of National Education Preschool Education and Primary Education Institutions Regulation (Amended: OG-10.07.2019-30827)

“Article 90;

(1) In pre-school education institutions;

a) To carry out educational activities in a healthy, appropriate, and safe environment, it is essential to have a playground and a garden and arrange them according to their purpose.

b) Arrangements are made when there is no training. While making this arrangement; Care is taken to support children's motor skills and cognitive development, to enable them to travel and play, to instill a love of the environment, and to allocate sufficient land area for a traffic training track, sand pool, garden play tools and afforestation of the garden.

(2) In primary education institutions, by taking advantage of environmental opportunities for students to travel, play, and engage in sports activities; Places such as sand pools, volleyball and basketball courts, and tools suitable for activities such as hanging, climbing, balancing, and jumping are provided.

(3) Periodic maintenance and repair of the playground and its equipment is carried out at least once a year.

Practice garden “Article 91 (1) In schools with suitable gardens, agricultural studies, and trials are carried out, ornamental plants and trees are planted, and grass areas are arranged.

(2) Fruit trees are planted in suitable places in the practice gardens of schools in villages. “Beekeeping, poultry farming, greenhouse farming, and organic vegetable and fruit production can also be done.”

It covers private education institutions within the scope of the Private Educational Institutions Standards Directive (Authority Approval dated 11.03.2020 and numbered 5331494) and the Private Educational Institutions Law numbered 5580, dated 08.02.2007.

Departments that should be in secondary schools,

“Article 17 Playground: There is a garden area of at least 500 m² suitable for ceremonies. “A 2 m² playground is allocated for each student.”

“Article 19 In case the secondary school and the secondary school or secondary schools are opened in the same building/buildings; These schools can share the health room, parent meeting/waiting area/room, prayer room/place of worship, elevator, multi-purpose hall, dining hall, indoor physical education hall, library and playground.

Article 12, In case the construction license/building occupancy permit is obtained as a school building and several or all of the preschool education, primary school, secondary school, or secondary schools are intended to be opened in these building/buildings; For secondary school/schools, there must be a separate garden, building entrance, access to floors from schools at other levels, and classrooms and student toilets and sinks of that school on the floor/consecutive floors reserved for each school.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

"Circular on the Implementation of the Occupational Health and Safety Law (No. 6331) (OG No. 28339 on 30.06.2012)" and the standard named "Primary Schools-Physical Settlement-General Rules" dated 14.04.2000 and numbered TS 9518 of the Turkish Standards Institute (TS 9518)

School principals, as employers, and teachers, as employees and providers, are obliged to implement the issues in the laws and regulations. It is possible to monitor risks and hazards in the environment by creating a Risk Inventory and Risk Assessment.

It may be possible to examine school gardens based on different criteria. The most important of these criteria is the garden area in square meters per student.

When the legal administrative framework of primary education facility areas in Turkey is examined, within the framework of the "Spatial Plans Construction Regulation" published by the Ministry of Environment, Urbanization, and Climate Change in 2014 and with the amendment made on 17.05.2017, the minimum area size for primary schools is 5,000, regardless of the population number. It is given as -8,000 m² and the area per person is determined as 2 m².

According to the Primary Schools-Physical Settlement-General Rules standard numbered TS 9518, dated 14.04.2000 of the Turkish Standards Institute (TSE), usage areas in school gardens should be planned to provide 5 m² of space per student.

- 1.1.9 - The school field must be surrounded by a garden wall; water, electricity, and sewage facilities must be available; Entrance and exit doors of the school should not open to a street with heavy traffic; Seating groups suitable for the size of student age groups should be placed in the garden and open sports areas should be arranged according to age groups.
- 1.1.10 - An open ceremony area should be arranged in the school garden, there should be an Atatürk monument or bust, this monument or bust should be illuminated, and there should be a sound system.
- 1.1.11 - Drinking water installation should be by TS 828, utility water should be by TS 266 and taps should be arranged in the break room and playground.
- 1.1.13 - The school must have a parking lot with the features specified in TS 10551.
- 1.4.6 - There should be a canteen within the school building or in a suitable place in the garden where students can purchase stationery, soft drinks, toast, etc.
- 1.4.11 - The parking lot must be far enough away from the private teaching institutions, if the population of the district where the school will serve is between 50000 and 200000, at least 250,00 m² for the gross school construction area of 600,00 m²; If the population is more than 200,000, at least 500,00 m² of parking space should be reserved, the ground should be covered with concrete, asphalt, concrete paving etc. in a way that will not be mud and water will not collect, and if possible, it should be closed.
- 1.4.13 - The garden should be away from harmful elements such as noise, smoke, and dust, and have a soil structure suitable for growing plants and trees, there should be a perimeter wall, drinking water fountains, seating corners, and open sports areas should

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

be arranged in a suitable corner of the garden, and a sufficient number of garbage bins should be placed.

- 1.5.4 - If there are student shuttle services at the school, there must be a parking area for shuttle vehicles and a waiting room for shuttle drivers with the features specified in TS 12257.

4. CONCLUSION and RECOMMENDATIONS

Compared to the Ministry of Education (1997), the standard determined by TSE (2000) foresees more open space per student.

However, in the next article of the relevant standard; 1.1.3 - While placing the building on the land, it is stated that it should be taken into consideration that the school building may be expanded in the future, and it is noted that this article, which foresees the reduction of the amount of open space in question, contradicts itself with the standard.

In the Educational Buildings Minimum Design Standards Guide, for school gardens built after 2015, it is stated that "Concrete and asphalt surfaces should be avoided so that school gardens do not have a cold and monotonous appearance, by the landscape project, large grass areas designed with a nature-based approach and climate control along the schoolyard perimeter wall." It recommends the standard "A regulation should be made that includes trees suitable for the region".

However, there is no regulation for old schools. According to the guide, buildings should be designed not to exceed 35% of the total area under optimal conditions. The remaining 65% of the area should be used as open space, green areas, and playgrounds.

In the determination section of the Ministry of National Education 2019-2023 Strategic Plan regarding the goal of including innovative practices that will increase the quality of schools in basic education.

It is stated that "School gardens are insufficient to support the social and cultural development of students".

Among the needs that must be met for the same goal, it recommends that "School gardens should be designed to support the versatile development of students and that lessons and extracurricular activities should be supported with cultural gains."

As social spaces that contribute to the mental, physical, and spiritual development of students, school gardens have an important share in ensuring the continuity of education and increasing its quality.

It should be aimed to make schools that encourage an active lifestyle attractive and enjoyable for students by arranging them with adequate equipment, green areas, and outdoor sports facilities.

To achieve the stated goals, a sufficiently large ceremony area, promenades, open and green areas should be left in school gardens, and outdoor sports facilities (volleyball, basketball, mini football fields) surrounded by wire fences and areas suitable for traditional children's games should be reserved.

ABSTRACT

Universities aim to provide professional skills through academic education and practices, to produce knowledge by conducting scientific, social, and economic-based practices and research, to prepare young people for social life by giving them duties and responsibilities, and to contribute to the education, awareness and cultural level of the society. Considering the city-university relationship of universities in cities, it aims to contribute to the spread of an ecological lifestyle due to their innovative features and their leading roles in society. For this reason, an important responsibility has been assumed when looking at the on-campus planting studies from this point of view. It has become an inevitable necessity for the campuses to be designed in accordance with ecological criteria, together with the buildings and open spaces. In the planting works, which are the most prominent in the campus, it is necessary to take into account the functional effects of the plant species to be selected, as well as their aesthetic effects. Plant species that can create a different effect in all four seasons in terms of color and texture characteristics should be included between buildings, squares, walking paths and special points. Noise, wind and dust curtains should be built where necessary. In the planting works, which are the most prominent in the campus, it is necessary to take into account the functional effects of the plant species to be selected, as well as their aesthetic effects. Plant species that can create a different effect in all four seasons in terms of color and texture characteristics should be included between buildings, squares, walking paths and special points. Noise, wind and dust curtains should be built where necessary. In this study, the plant design project of the central rectorate building of Isparta University of Applied Sciences, located in the city center of Isparta, will be discussed and evaluated at the campus and city scale.

Keywords: University, Design, Plant Design.

1. INTRODUCTION

Universities, which are among the institutions where knowledge is produced and shared, have an important role in the development of societies and therefore individuals.

While university campuses serve the use of students for educational purposes, they also appear as intensive social areas due to the recreational opportunities that students and university employees have in their extracurricular activities.

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

When we look at the city-university relationship of universities located in the city center along with the development of cities, universities contribute to the spread of an ecological lifestyle in the city due to their innovative features and leading roles in society.

Ecological design, one of the most important concepts of today, is a key concept that aims at high efficiency and aims to ensure that the functions of any social, economic or ecological system continue uninterrupted without damaging or consuming the resources used. In this context, it is necessary to develop microclimatic data, effective energy and material resources, effective use of topographic data, effective use of natural resources and evaluation of vegetation.

The design studies carried out on the campuses should enable many functions such as ensuring the integrity of the environment by considering the existing structural areas and open-green areas as a whole, creating circulation for vehicles and pedestrians, suggesting suitable areas for physical developments and uses, and creating recreational areas (Akten & Torun, 2021). University campuses, where green cover is dominant, provide many positive contributions to the people using the space (Hipp et al., 2016). When viewed from this perspective, an important responsibility has been assigned to the planting activities on campus. Designing campuses, including buildings and open spaces, in line with ecological criteria has become an inevitable necessity. Plants have positive effects on the area by changing the temperature in their environment by a few degrees, such as heat control, stopping wind, precipitation and radiation. According to Liu and Sullivan (2016), seeing a green environment in the classrooms within the educational fabric reduces students' stress and mental fatigue.

Designers need to choose the right plant that will have an impact on the climate, considering the current climate conditions and human needs for comfort.

Botanical design; In addition to being a branch of art that emerges as a result of the relationship between humans and nature, they also adds different meanings and functions to the spaces where they are used, depending on their aesthetic and functional purpose, by helping to restore the balance between humans and nature. Planting works, which are the most visible on campus, should be carried out by taking into account the functional effects as well as the aesthetic effects of the plant species to be selected (Akten & Gül, 2007).

In addition to creating spaces with high visual quality in botanical design works, the use of vegetal structures (leaves, flowers and fruits) is also very important. For this reason, designs should be considered multifunctional within the "urban open and green space system". Plant species that can create different effects in four seasons should be included between buildings, in squares, on walking paths and at special points, in terms of color and texture. Noise, wind and dust curtains should be installed where necessary.

University campuses have undertaken the task of creating a model on a universal, national and regional scale with their land use, structural and plant designs all over the world. Rectorate buildings, which are the administrative structures that make up the dynamic structure of universities, hold an important place in university campuses in the physical context, while at the same time, they are the showcase of the university in social terms. Therefore, campuses are areas that provide aesthetic, ecological, economic, and recreational contributions as well as their socio-economic and cultural contributions to the cities they are located in with their open and green space planning (Akten & Torun, 2022).

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

The goal of ecological landscape designs is to create landscape areas where plants grow healthy, grow well, and require little maintenance. In this respect, choosing the right plant in design is a prerequisite for achieving this goal.

In this study, the plant design project of the central rectorate building of Isparta University of Applied Sciences, located in the city center of Isparta, was discussed and information was given about the plant design studies.

2. MATERIALS and METHODS

Materials

Isparta University of Applied Sciences Rectorate building is located in Doğancı District in the center of Isparta (Figure 1).

On December 9, 2019, an area of 62.000.500 m², including 6 buildings, including the old hospital building, was transferred from the National Real Estate Directorate of the Provincial Directorate of Environment, Urbanization and Climate Change to Isparta University of Applied Sciences (URL, 1). Project work started immediately after the allocation of the study area to the university. Within the university's central campus;

A Student Dining Hall with a capacity of 1000 people, a Staff Dining Hall with a capacity of 400 people, Social Areas, a Pocket Cinema with a capacity of 68 people, and a Theater Hall with a capacity of 83 people, with a total construction area of 5,647.80 m², are planned as student living areas in Zirve Campus. In addition, a Conference Hall with a capacity of 340 people, 2 Congress Halls with a capacity of 115 people, 3 Meeting Halls and 2 Foyers (Exhibition Area) will be built within the 4.188,90 m² Congress Center.

There will be 58 Classrooms, 5 Lecture Halls, 2 Meeting Rooms, 4 Seminar Rooms, 3 Computer Halls, 8 Computer Laboratories, 2 Technical Drawing Halls within the 14,000 m² area.

The Total Construction Area of the building, which is being constructed by Isparta City Services Association, is considered as an additional building for central classrooms in the area of the Old Maternity Hospital: 5100 m². 1500 Student Capacity, 16 Classrooms, 1 Technical Drawing Hall, and 18 Staff Rooms are planned (URL, 1).

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

The study area is the historical building (old state hospital building) known as the Stone Building, built in 1946, located within an area of 4080 m², and the new rectorate building around it (Figure 2, Figure 3).

Figure 2. Rectorate building front view

Figure 3. Rear view of the rectorate building

Methods

The study was carried out by evaluating the current situation in the rectorate building and the surrounding campus area, observations made within the boundaries of the study, photographs taken and determinations within the scope of ecological design principles.

Within the scope of the study firstly, the spatial and operational requirements of the historical building, which was protected and maintained with a new function, were determined and analyzed, taking into account the features that constitute its identity.

By examining open and green space usage requirements and outdoor usage needs through spatial analysis, the following evaluations were made:

Determination of exterior opening points and elevations of the existing building,

Determining the relationship between the circulation system and parking needs within the project area,

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Determining user needs,

Analysis of natural landscape data.

In addition, a literature review, on-site observation, and functional analysis of the historical building environment converted into a university building were carried out.

Findings and Discussion

The historical building (former state hospital building) and its surroundings, known as the Stone Building, built in 1946, will be opened for use as the new rectorate building upon completion of the restoration work.

Natural factors such as land and environmental relations, land topography, relationship with the city, climate condition, soil properties, and geological structure are very effective in planning decisions regarding campuses.

The basis of ecological design on campuses is based on understanding the relationship between environmental processes and user needs. Physical, biological and social relationships are within the scope of landscape design.

The ecological approach in landscape design and management requires taking nature itself as a model in area design and bringing solutions that are compatible with natural processes and the structural and ecological characteristics of the area.

The main goal is to develop a self-sufficient, sustainable system that can be a part of the urban ecosystem.

During the plant design process, the campus area and its surroundings were examined and its relationship with its immediate surroundings was revealed.

In line with the environmental data determined, attention was paid to preserving the image and identity values of the rectorate building due to its historical features.

The existing vegetation in the area has been accepted as a guiding feature in vegetative design. All plants in the area were preserved, and care was taken to ensure that the new plants selected were compatible with the existing plants and suitable for climatic factors.

To begin with, 25 different types of plants were used in the project for the first stage.

Species names;

Magnolia grandiflora, *Liriodendron tulipifera*, *Prunus cerasifera*, *Morus pendula*, *Cercis siliquastrum*, *Malus floribunda*, *Tilia tomentosa*, *Laurus nobilis*, *Tamarix sp.*, *Olea europea*, *Lagerstromia indica*, *Abelia grandiflora*, *Chaenomeles japonica*, *Ligustrum vulgare*, *Eonymus japonica var. Aurea*, *Lavandula officinalis*, *Berberis thunbergii*, *Photinia red robin nana*, *Pittosporum tobira 'nana'*, *Viburnum opulus*, *Buxus sempervirens* *Ajuga reptans*, *Nandina domestica*, *Cotoneaster horizontalis*, *Vinca major*.

When choosing plants, attention was paid to the change in the form of deciduous and evergreen trees over the years.

The vegetated areas within the campus, which are located within the dense urban structure, will also serve as the green area of the city. On the other hand, plant material also has effects such as air quality control, slope stabilization, and climate regulation.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

It is aimed to create a visual landscape, noise reduction, or air quality improving effect by creating a "green belt" effect around the building's road axis. Shrubs were mostly used at the borders of the area to protect from noise and dust.

Since the Rectorate building is located on the main road axis, areas arranged at different elevations have been created with planting in order to reduce the noise caused by pedestrian and vehicle flows and not to draw attention to other directions. In this area, *Malus floribunda*, *Tilia tomentosa*, *Tamarix sp.*, *Laurus nobilis*, *Abelia grandiflora*, *Chaenomeles japonica*, *Ligustrum vulgare*, *Lavandula officinalis*, *Berberis thunbergii*, *Photinia red robin nana*, *Pittosporum tobira nana*, *Ajuga reptans*, *Cotoneaster horizontalis* and *Vinca major* plants used.

Since the Rectorate entrances are also an important institutional symbol in addition to their general functions, attention was paid to the use of attention-grabbing plants for emphasis.

The front garden, where the main entrance of the Rectorate building is located, was designed as a welcoming area and was intended to be emphasized with plants. For this purpose, *Olea europea*, *Eonymus japonica var. aurea*, *Lagerstromia indica*, *Photinia red robin nana*, *Buxus sempervirens*, *Malus floribunda* and *Cotoneaster horizontalis* plants were used.

In the road connections within the area, plants that are the same in form, size, texture and color are included, again taking into account the principle of rhythm, unity and balance.

The part of the Rectorate building opening to the backyard was used as a places where recreational activities were held. While users are provided with the opportunity to rest, sit, watch and move actively, the design has been shaped by considering the naturalness provided by grass surfaces, plants and area plastic.

It is aimed to create shaded and cool areas, protected against weather conditions, by using plant and structural materials in the seating areas at the back of the rectorate building.

Two different spaces were created on the campus by creating horizontal and vertical planes with different types of plant materials used. Tall plants were used for screening purposes between these areas.

In addition, the herbal materials used:

- ✓ complementary,
- ✓ router,
- ✓ unity builder,
- ✓ softening the sharpness of the space resulting from its structural form,
- ✓ Care was taken to create a design that frames the view of the area to introduce and emphasize its historical features.

Morus pendula, *Prunus cerasifera*, *Lavandula officinalis*, *Berberis thunbergii*, *Viburnum opulus*, *Liriodendron tulipifera*, *Pittosporum tobira Nana*, *Abelia grandiflora*, considering their functional functions such as accessibility in the parking lot and road route, characterizing the space, creating a backdrop, establishing a relationship with the rectorate entrance, and orientation plants such as were preferred.

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

Creating a buffer area with the planting used around the designed parking areas is aimed at hiding the harsh appearance of the parking areas and at the same time creating shadow areas for the vehicles.

The ramp used as a pedestrian entrance was evaluated as a negative image in terms of design due to the materials used with the historical building and the slope analysis.

Creating an area compatible with the stone material used in the structure of the existing building, which is unique to traditional buildings, and emphasizing the main entrance with plant pots as a welcoming area at the entrance were considered at the design stage.

3. CONCLUSION and RECOMMENDATIONS

Today, many of the cultural assets that are protected due to their historical values in the world and our country can become sustainable with a second function. Reintroducing and using the structures evaluated in this way to the society; Although they remain neglected and abandoned structures, they are considered a positive initiative.

The change in the function of an existing and previously used building, depending on the changing conditions and needs of the period, also leads to design studies taking into account the preservation of the historical values of the place.

Creating a space identified with its new function contributes to making it livable. In this context, the existing stone building, which has survived structurally but lost its identity functionally, will assume a new function when it begins to be used as the university rectorate building, and in this process, it will gain an ecological and aesthetic value with the vegetal designs made in the open and green areas around the building, which will contribute positively to the city of Isparta. It is thought that it will contribute. For this purpose, a holistic, balanced campus design scenario that takes into account the values of the geography in which it is located was developed with the decisions taken in the plant design of the Rectorate Building of Isparta University of Applied Sciences Zirve Campus, located in the city center.

In the campus, open and green area design, attention was paid to preserving the architectural character of the building and improving its visual character. In addition to their basic functions, the materials used in campus outdoor design can also have a complementary effect on spaces with their qualitative features. For this reason, the plants used in the campus vegetal design help preserve the unique identity of the campus.

Using local plants, is aimed to reduce maintenance costs and allow the plants to adapt to the environment without experiencing any adaptation process or losses. In plant design, attention was paid to creating a space design that is ecological and functional, resistant to climatic conditions, contributing to the identity and prestige of the university, compatible with the environmental texture, directly related to the educational texture, and usable day and night.

In the vegetative design of the area, the existing vegetal texture, mainly *Pinus nigra*, which was previously randomly planted in the area, has been completely preserved. For the educational texture around the area to form the plant design decisions, sequential plant designs that can create a visual impact in all seasons were used.

When the plants reach the designed sizes and diversity and the equipment takes its place in the spaces, the designed project will have a more effective appearance. In addition, after the plant use study of the Rectorate building is completed, some additions and deletions can be made in

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

the application by taking the opinions of those who use this area with the "post-use evaluation" method, and the findings obtained from this evaluation will be guiding in the other phase studies of the campus.

Thanks and Information Note

Isparta University of Applied Sciences Zirve Campus Rectorate plant landscape design project was prepared and delivered to the Construction and Technical Works Department on 08.03.2023.

ABSTRACT

Architectural project competitions have a great impact on both the architectural sector and architecture education. To guide and inform as an instructive resource on behalf of the competition sector, this research was conducted through the Istanbul Maritime Museum for the examination of architectural project competitions. For this research, the Istanbul Maritime Museum Architectural Project Competition, organized by the Turkish Naval Forces Command in 2005, has been examined chronologically and focuses on informative points about architectural project competitions by archiving the specifications, the list of needs, the winners during the competition process and the drawings of the winner project. In the further process of the research, the first prize-winning project made by Teğet Architecture was examined by the architectural drawings, the construction process and the completed version of the structure's comparison. The transformation process of the architectural project was observed and documents acquired by Teğet Architecture, articles written about the Istanbul Maritime Museum, and interviews published in journals have guided the development of the research. To ensure that the employees of the museum participate in the examination process, different interviews are indicated in the report. The research was intended to guide the studies about the Istanbul Maritime Museum and contribute to the development of architectural project competitions. The report was completed by studying on obtaining the academic data necessary for the interpretation of the Istanbul Maritime Museum competition.

Keywords: Istanbul Naval Museum, Naval Museum, Architectural Project Competition, Museums, Architecture.

1. INTRODUCTION

The naval museum was opened for the first time in 1897 as a small building called 'Museum and Library Administrative' with the permission of Sultan II. Abdulhamit. In 1961, it was moved to its current location, Iskele Square in Besiktas district, where Barbaros Hayrettin Pasha's monument and tomb were located, and it was put into service as the 'Directorate of Maritime Museum and Archive'. It was first opened for exhibition as a museum warehouse, and categorization was made in 1914 when Cemal Pasha, who was the Minister of the Navy, appointed the Sea Captain and painter Ali Sami Boyar, as the museum director. In 1917, Ali Sami Boyar established the 'Ship Model Workshop' and the 'Mulaj (casting)- Mannequin Workshop', which enabled the maritime museum to develop visually. At the beginning of the 20. century, the aircraft hangar located next to the museum's main exhibition building was allocated to the museum as a boat repair workshop and garage. The building was started to be

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

used in 1971 as an area where galleys and reign boats in the maritime museum collection were exhibited under the name of 'Historical Boats Gallery'. Since the problems caused by the fact that the Historical Boats Gallery was not built as a museum and could not provide enough space, could not be solved, the Naval Forces Command announced an architectural project in 2005 and announced the competition that made the Istanbul Maritime Museum.

In 2008, the procurement for the new museum building was finalized and the construction of the project, which includes the Main Exhibition Building, the Historical Boats Gallery, and Outdoor Exhibition Areas, was started. A temporary warehouse was built to protect the boats during the construction process, and the boats were moved to this warehouse in 2009. In 2013, the restoration works were completed and the Historical Boats Gallery was opened to the public.

2. MATERIALS and METHODS

During the research process, the direction of writing the report was given by conducting the review from multiple sources and the necessary literature review, archiving the sources found through multiple architectural journals. To access the necessary documents of the Architectural Project Competition, such as feedback and drawings of the winning projects and specifications of the competition, resources were collected by contacting different digital archives. To be able to examine the architectural project competition in a multi-layered way, the necessary process was prepared, so that the stages from the announcement of the competition to its construction could be followed chronologically.

The competition was announced by the Turkish Naval Forces Command in 2005 as a National and single-stage Architectural Project Competition. The main jury consisted of Mete Ünal (Prof. Architect), Afife Batur (Prof. Architect), Mine Inceoğlu (Prof. Architect), Ihsan Mungan (Prof. Civil Engineer), Hüsenyin Kahvecioğlu (Asst. Assoc. Dr., Architect), who are valuable leading names in the development of Turkish architecture. Likewise, the participation of valuable names from the naval forces command in the consultant jury, such as Bülent Aksaray (Dz. Kd. Colonel) and Aydın Soğukpınar (Eng. Lieutenant Colonel), was a supportive fact that the competition was evaluated and reviewed as a joint study.

The list of project requirements that have been approved for the competition is shown below. the desired areas other than some private living quarters and technical environment usage areas are shown in Table 1.

September 14-15, 2023, Naples, Italy

Table 1. Istanbul naval museum architectural competition requirement list

exhibition areas	
display of royal boats (average value)	6000 m ²
object display	1000 m ²
cultural areas	
temporary exhibition hall	400 m ²
multi-purpose hall (at least 200 people)	450 m ²
visitor cafeteria+kitchen(50 people)	180 m ²
library	50 m ²
cinevision room	50 m ²
children's lounge	100 m ²
service area	
consultation-promotion-book sale-souvenir	20 m ²
wc(male-female-disabled)	
exhibition warehouse (3 units, one of which is 150 m ²)	450 m ²
workshops	
painting workshop (1 person)	20 m ²
wood restoration workshop (1 person)	20 m ²
Conservation Workshop (2 persons)	40 m ²
chemistry laboratory (1 person)	20 m ²
ship model restoration workshop (1 person)	20 m ²
carpentry shop	50 m ²
electrical workshop	20 m ²
electricity warehouse	20 m ²
paint warehouse	20 m ²
gift-book warehouse	20 m ²
offices	
male-female wc	20 m ²
commander	20 m ²
administrative office (2 people)	12 m ²
public relations (1 person)	10 m ²
supply branch manager	10 m ²
supply office (5 people)	30 m ²
property treasurer (2 persons)	12 m ²
head of the museum group	12 m ²
museum department manager	12 m ²
museum researchers (3 people)	18 m ²
exhibition part (4 people)	24 m ²
museum department supervisor (3 people)	18 m ²
security service team (4 people)	24 m ²
briefing-meeting room	50 m ²
tea Center	10 m ²
open spaces	
children's playground (minimum)	500 m ²
open display areas (minimum)	1000m ²
private living quarters and technical environment	568 m ²
THE TOTAL AREA WILL BE 11.000 M ² at the most.	

The documents to be given to the contestants include various documents such as competition specifications, zoning plan, ground condition plankote study, museology report, objects to be exhibited and information about optimal exhibition conditions, property information, current historical boats gallery and boats layout plan, current exhibition building plan sketch and photos. The documents requested from the contestants are situation plan(1/500 scale), plans(1/200 scale), sections and views (1/200 scale), details(1/50 scale), free explanatory drawings, model (1/500 scale), perspective, explanation reports to be added to the project.

Figure 1: 1st place naval museum Project (<https://www.arkiv.com.tr/proje/http---arkivcomtr-proje-istanbul-deniz-muzesi-2784/2784>)

1st place project No.40: Teğet Architecture

- Architects: Mehmet Vehip Kütükçüoğlu, Ertuğ Uçar, Hande Köksal
- Assistants: Mehmet A. Kiremitci, Mert Uçer, Yıldız Aslandogan, Esatcan Coskun,
- Static: Hakan Çatalkaya
- Machine: Mehmet Okutan, Celal Okutan
- Electricity: Hayri Aydin

The comments made for the first prize project by reaching the specifications and feedback of the project are as follows:

“As Simplicity and success in the building form, interior design and external reflection of the museum's general exhibition concept, functional relationships created starting from the building entrance, maturity and advanced level in spatial organization, effective public space created at the approach and entrance via Dolmabahçe Street, uninterrupted exhibition environment made possible by the selected carrier system setup, the possibility of multidimensional perception offered by this setup with the building structure, success in embodying the conceptual approach developed on the exhibition of the reign boats in space, the mastery in participating in the exhibition context of the visual relationship provided by the outward openings with the strait, the contribution of the reflections that the water element on the sea front will create in the space where the boats are exhibited to the space, the presentation of the possibility of perceiving the boats from the outside in a measured way on the sea front have been found successful. This project is a project in which the entire internal and open space circulation can be controlled from a single point of view by joining the museum circulation axis of the existing exhibition building, in other words, the internal movements of the museum can be completely solved from the point of view of enterprise security. The smallness of the open exhibition area and green space left in response to all these positive features, the problems observed in the floor selection and organization of private living quarters and administrative spaces, the weakness in the stairway and ramp system connecting the entrance hall and the galleries, the problems in the installation scenario during the construction process were seen as the negative aspects of the project. As a result of the evaluation made in this project, a mature and generally qualified museum structure design has been achieved; it has been concluded that the structure, with which the problems and disadvantages it carries can be solved by the recommendations of the jury without disturbing the main decisions of the project, has no problems in terms of technology

- Architects: Cem İlhan, Tülin Hadi
- Assistants: Arcan Aksakaloğlu, Şefika Güner
- Static: Yusuf Timbır
- Machine: Ayşegül Yıldız
- Electricity: Metin Sıcakyüz

The comments made for the second prize project by reaching the specifications and feedback of the project are as follows:

“The logic and fiction of the general exhibition, the customized location of the historical galley and the visual relationship it establishes with the open exhibition areas, the integration of the water element in open areas with indoor spaces, the fact that a suitable environment for museology could be provided in good conditions, the easing of the mass spread over the land to the evacuees from place to place are the positive aspects of the project. Weaknesses in the location and spatial layout of the main entrance of the museum, weaknesses in the transition from the entrance hall to the exhibition hall and the solutions for connecting the new building to the existing building, the location of the er living quarters and entrances on Dolmabahce Street, the inability of the building to open with pedestrian access to this street and the sea direction, the deaf structure of the sea facade, the visual quality of the building is not strong enough in terms of the museum image were seen as negative aspects of the project. The project was unanimously awarded the second prize.” (<https://www.arkitera.com/yarisma/istanbul-deniz-muzesi-ulusal-mimari-proje-yarismasi/>)

- Architects: Dilek Topuz Derman, Fırat Gülmez, Cihan Sinan Bostancı
- Assistants: Onur Canvarol
- Static: Niyazi Parlar
- Machine: Caer Aktürk
- Electricity: Hayri Aydın

The comments made for the third prize project by reaching the specifications and feedback of the project are as follows:

“The minimalist and simple approach in the solution of the building, the rich green areas and outdoor spaces obtained accordingly, the separate display of boats in their own private spaces, and the transparent outer walls also offer visitors the opportunity to perceive the open exhibition areas during internal circulation were found positive. The entrance hall, existing building connection and relationship weaknesses in internal circulation and illegibility sometimes turn into directionless and insufficient circulation areas, indoor ramp slopes reach a challenging level, construction stages of the building and uncertainties in the positioning of boats into the building, location selection of early living quarters and offices and related spatial inconveniences are the negative aspects of the project. he was awarded the third prize with a majority of 3-2 votes.” (<https://www.arkitera.com/yarisma/istanbul-deniz-muzesi-ulusal-mimari-proje-yarismasi/>)

3. FINDINGS and DISCUSSION

The new building of the maritime museum is designed around a courtyard that can be considered an open-air exhibition space, taking the museum visitor to the entrance hall from Dolmabahçe Street, and the square-shaped circulation in the museum around the courtyard, the visitor completes his uninterrupted museum tour by passing through the existing exhibition building and back to the entrance hall. At the entrance hall, the building is divided into two zones A and B zone. A contains reign boats, full and half ship models, and other objects, while

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

zone B consists of a multi-purpose hall, foyer, exhibition hall, entrance hall, library and other support units. Zone A has two separate sections within itself:

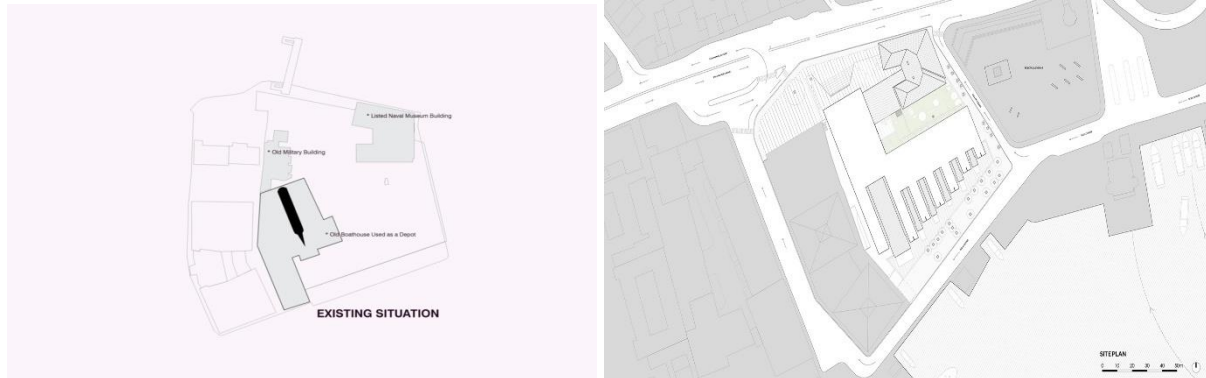

Figure 4. Before and after drawings of naval museum situation plan (<https://www.arkitektuel.com/istanbul-deniz-muzesi/>)

Boathouse: The boathouse is the place where the main collection is exhibited. At the entrance to the boathouse, the largest sultanate ship, which is 58 tons, faces the sea, but it is visible beyond the stairs, and a view of Besiktas port can be seen from above. In the same way, it is seen that the reign boats are ordered historically in chronological ways. While an uninterrupted view is provided on the ground floor with steel bridges seated on reinforced concrete curtains, the mezzanine floor, where smaller boats are located, allows the ground floor to be perceived from the upper level.

Figure 5. Istanbul Naval Museum ground (left) and first (right) plan drawings (<https://www.arkitektuel.com/istanbul-deniz-muzesi/>)

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 6. Istanbul naval museum section drawing of the boathouse
(<https://www.arkitektuel.com/istanbul-deniz-muzesi/>)

It is seen that the reign boats are exhibited on the ground floor of the new museum building and are placed on wooden seats specially made for the size of the boats, which are surrounded by metal ropes to protect the wood from touch. The undivided circulation of the ground floor with columns was designed as turning around the reign boats with the guidance of metal ropes, and a comfortable corridor network was created through which wide openings were passed. It is seen that the ceiling and floor wall units are made of copper material in a color to match the reign boats, and artificial lighting mixes with the flow of architecture with copper material units.

Figure 7. Istanbul naval museum boathouse ground floor photos (from the photo archive taken by the author)

Teğet architecture's description report describes the project as follows: The existing Maritime Museum in Beşiktaş is a lost, forgotten complex in the center of Istanbul. The developed proposal, together with its invaluable content left in a nook, puts this area on the shores of the Bosphorus of Istanbul into the use of the city. (...) The designed new Istanbul Maritime Museum complex is built around a courtyard that is considered an open-air exhibition space. The boathouse is the place where the main collection of the Istanbul Maritime Museum is exhibited. The boathouse is shaped like fingers extending from the first hall, where the Galley is displayed in the westernmost, to the last hall, which is divided by a steel bridge in the easternmost, to the sea. The boats lined up on the dock as in their former lives want to return to the sea. (<https://www.arkiv.com.tr/proje/http---arkivcomtr-proje-istanbul-deniz-muzesi-2784/2784>)

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 8. Istanbul Naval Museum Mezzanine floor photos (from the photo archive taken by the author)

Transportation from the ground floor of the new museum building to the first floor is provided by a ramp at the very end of the circulation network. It has been observed that the information boards with miniature models of famous submarines, ships, and boats hanging on the left side of the ramp, it was used in the informative function. It is also seen that the exhibition of the reign boats is continuing on the first floor of the new museum building and that the exhibition is made of intermittent sections carried by steel structures that serve both aesthetic and architectural purposes.

The Current Exhibition Building: The existing building in the Istanbul maritime museum is supported instead of being closed by the new building and is connected with a bridge to the upper level of the existing exhibition building from the mezzanine floor of the new building. The circulation continues downwards and directs the tour to the starting point. In the old museum building, a dark exhibition hall is opened and there are models, items, and descriptions of sailors and ships in history in this area. The dark exhibition halls on the first floor of the building have been solved on a single corridor axis with a plan that does not require the individual to move around.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Figure 9. Istanbul Naval Museum Bridge between mezzanine floor and upper level of the existing exhibition building and exhibition hall (from the photo archive taken by the author)

With the contribution of the researched interviews and the documents obtained from the Teğet Architecture office, it was possible to examine the participation and design process of the Istanbul maritime museum competition. The interviews given by the architects of the Istanbul maritime museum and the points they emphasize about the structure are of great importance. Some of the explanations obtained to ensure the multifaceted intelligibility of the building are shared within the scope of the study:

- What we propose with the structure of the Maritime Museum is a calming in the stifling atmosphere of the center. The square we have created on the Dolmabahçe side by retreating from the Decking line is a new stopover, a meeting place for people stuck on the sidewalks. This area, which is included in the city space with a gesture, shows the stance that the museum will take on its social role. The facade surfaces and lines that surround the island and cover all the facades in the registered building breathe into the urban fabric, which is fragmented into a thousand facades in small parcels. The perception that is tired in the city is resting on large surfaces. (interview sections obtained from documents sent by Teğet Architecture)
- Of the 34 boats to be exhibited, 20 of them are more than 10 meters long and 8 of them are more than 20 meters long. The most valuable piece is 16. it is a 40-meter-tall galley dated to the century. These 34 boats are arranged in the exhibition layout we have proposed, parallel to each other and with their noses pointed at the Bosphorus in

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Istanbul. Looking at the structure from the Bosphorus, he sees a large boathouse where sleds lie out of his eyes. If you look from the museum to the Bosphorus, what you see is a dock: the final supply of a fleet waiting to be opened is being made. (interview sections obtained from documents sent by Teğet Architecture)

- The circulation diagram of this building is very clear. The entrance opposite the bazaar is very obvious. When you enter from there, the view pulls you toward the Bosphorus, then you visit the boat gallery and a large ramp takes you upstairs. When you are traveling, you look at the things you have looked at from different levels and angles again. This time you are looking at the boats you are looking at from the ground from above, and from one side you see those on the top floor. When you walk around that floor and go all the way to the end, you cross the bridge and come to the upper floor of the registered building. There will also be a lot of small objects in it, such as clothes, models, and books. From there, when you go downstairs by a staircase, you go back to where you started from the passage on the boulevard side. It has a closed-circuit circulation resembling a three-dimensional spiral. (<https://xxi.com.tr/i/tersaneyeyokunen-muze-binasi>).
- When we are trying to plan and design a little bit about the problems experienced with the employer, the relationship that we think the Maritime Museum should establish with the city, employers are operators, and their habits are also important here. If part of the energy we spend while these buildings are being realized is in the design process, part of it is to convince the building owner of this relationship. For example, the Maritime Museum is an institution operated by the Navy, which is actually trying to civilize on the one hand. As we all know, there are security problems in the country. (interview sections obtained from documents sent by Teğet Architecture).
- Another important point is that the facade of the museum can be reached without any fence or wall. In order not to build a fence, we tried to explain our problem to every incoming commander starting from scratch and we accomplished a difficult thing. During the period from the competition to the construction of the museum, a hotel was built next to it. We suggested to them to connect the square in front of the museum with the place in front of the hotel, but we couldn't. They pulled a wall together and put their Decking behind it. However, if it had presented integrity, it would have been interesting, and it would have turned out to be an advantageous use for the hotel. (<https://xxi.com.tr/i/tersaneyeyokunen-muze-binasi>)
- Someone from Mimar Sinan University takes measurements with solar measuring instruments while doing his military service there. After that, he wrote an article on "the negative effects of daylight on the inventory at the exhibition" and mentioned the daylight coming to the nose of the boats and sent it to the magazine of the Chamber of Architects. So we suggested that he meet with us because the article was scientific in that way; it was a scientific-looking article with light graphics, etc. next to it. We wanted to meet with the author to develop it, but it didn't happen. Then one day when I saw the article in another magazine of the Chamber of Architects, I wrote a short text and put the title "Positive Effects of Sunlight on Marine Museum Inventories". We have oriented the mass of the building according to daylight, it provides protection; it also has protection on the roof, but they did not make the sensor-based sunscreens that we

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

recommended for the facade, they did not apply the UV values that we consider appropriate for glass. (interview sections obtained from documents sent by Teget Architecture)

Figure 10. Istanbul naval museum photos (from the photo archive taken by the author)

In order to evaluate the building, employees and officers who accepted were interviewed, and feedback from the people who used the building the most was received. The officers declined to give their names because of the institution they work for. However, the fact that the views discussed on the important points of the maritime museum are identified and it is seen that there are different points of view on these issues enriches the understanding of the project.

- The first example that can be given to these views may be some points that officer 1, who participated in the interview, emphasized. One of these points is that cracks appear under the 58-ton large reign boat located at the entrance of the boathouse. Even if the cracks are considered to be superficial, no care is taken to ensure that these cracks do not widen more or that the minor difference in level can be fixed.

Figure 11. Istanbul Naval Museum ground floor (from the photo archive taken by the author)

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

- The comment of another officer who participated in the interview is a comment criticizing one of the reasons why the museum was liked by the main jury. This interpretation, which looks from a different perspective, is that the feeling of curiosity beyond the walls in the museum, the feeling of progress by wondering about the next gallery, is damaged by ensuring visibility in the new museum building. The same officer also believed that the visibility of the ground floor, without columns and walls, causes a visual mess due to the steel structure carriers located on the mezzanine floor.

Figure 12. Istanbul Naval Museum ‘visibility design’ in the exhibition of the old building and the new one (from the photo archive taken by the author)

- The opinions of the third officer who agreed to participate in the interview are not an architectural interpretation, but an issue that makes it difficult to control the order between the visitors and the reign boats. The officer emphasized that the reign boats are not enough to be protected by being surrounded by metal ropes, which museum visitors can touch. He considers that the reign boats are intertwined with the circulation network in the museum exhibition and the ‘accessibility’ of boats, is considered as an obstacle to the officer who is responsible for the protection of the reign boats. The comment of the officer who works in one of the relevant offices and agreed to participate in the interview is that providing access to the upper floor of the boathouse only by the ramp is not suitable for the elderly and disabled. He emphasized that some people have been witnessed returning even after buying their tickets for this reason.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 13. Istanbul Naval Museum ramp in new building circulation (from the photo archive taken by the author)

- Along with noting the very different interpretations from each other and examining the versatility of the decisions made in the design of the maritime museum, there is a similar opinion received from most of the people who participated in the interview. This view is the slight sway felt in the new building when the ships at sea dock firm on the Beşiktaş shore since the land on the coast is built on the made ground. Some of the officers are concerned about the earthquake resistance of the building and express that they are more prone to shaking compared to the old building.

The preference for steel structure in the construction of the building was seen as the most suitable option for earthquake resistance and coping with the filling/made ground. In this case, although the durability of the new building may seem insufficient to prevent slight fluctuations in the building, it is observed during the research on design and construction stages that the necessary structural work is carried out.

4. CONCLUSION and RECOMMENDATIONS

The Istanbul maritime museum competition is a project that has been advanced in many ways and has been made with great effort due to a construction process that requires minimal movement of reign boats on land. It is seen that the correct establishment of the relationship with the old exhibition building and the placement of the reign boats in the new building with the correct designs were important architectural decisions in the competition. Thanks to the correct design decisions made by Teğet Architecture, the Istanbul Maritime Museum has reached its current state, and the benefits of not putting up a fence around it for protection, playing a wide, crowd-relaxing role in public and on the street can be seen to this day. The fact that the Maritime Museum has never approached the registered building with its two-story mass and has fallen to a single floor on the boulevard side shows that it is a supportive element by slowly merging with the structure in the background while bringing the structure to the foreground. Teğet Architecture has successfully brought to the fore the old exhibition building surrounded by the Barbaros Statue and Tomb, the Sinan Pasha Mosque. On the side of Besiktas Square, Teğet Architecture successfully solved the spiral circulation system constructed inside

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

by connecting the two buildings with a transparent bridge. A clear understanding of the points that are important in the process of the Istanbul maritime museum architectural competition, the list of needs, and the features requested from the competition project in the specification makes an important contribution to the development of the project. The creation of a structure that can provide access to the land without damaging both the sultanate boats and the old exhibition building and the ability to provide the most suitable way of navigation for the museum visitor is the success of the project. Understanding and supporting the development of architectural project competitions with this project is one of the goals of this article, but it is desirable to be a stepping stone to future research.

Thanks and Information Note

I offer my special thanks to Prof. Cüneyt Kurtay, who supported and guided the process in the analysis and interpretation of the Istanbul Naval Museum article; to Teğet Architecture, for sending the relevant documents digitally and to contribute to the development of the article; to the work of the archives that play a role in finding important competition documents such as specifications, list of requirements.

ABSTRACT

This study examines the construction process of the Turkish Republic Presidential Symphony Orchestra Concert Hall and Choir Study Building, also known as CSO, a competition project that took 28 years to bring into use. The tender for the competition, which was opened in 1992, could only be made in 1995. The opening of the building, whose architects are Semra Uygur and Özcan Uygur, was held in 2020. From the competition stage to the tender process and from there to the completion of the construction, the process has been stopped for many different reasons. For this reason, problems occurred in the structure, but these problems were overcome with design decisions. Interviews were made with the architects of the project and the site manager to describe the process. In addition, printed sources archived by the architects of the project were used. Incorporating evidence from reviews, personal correspondence, and newspapers, this study points up problems encountered during the process and architectural solutions developed. As a result of the examination made specifically for this project, it has been revealed the architectural competition projects have undergone radical changes and transformed until the construction is completed.

Keywords: Architectural Competition, Construction Process, Cultural Heritage, Architectural History, Pneumatic.

1. INTRODUCTION

This study presents content related to studies conducted within the framework of the "Special Topics in Architecture" course as part of the Master of Architecture program at Başkent University. Within the scope of the course, the journeys of architectural competition projects, whose implementation phase has been completed, are examined, highlighting the differences between the award-winning competition project and the completed construction project. In this context, throughout this study, the processes from the competition phase to the completion of construction of the Presidential Symphony Orchestra Concert Hall and Chorus Working Building, which won first prize in the 1992 competition but was completed after 29 years, have been scrutinized.

The Turkish Presidential Symphony Orchestra has been in existence since 1826, making it one of the world's oldest orchestras. This historical orchestra, nearing its 200th year, was relocated to Ankara on April 27, 1924, under the orders of Mustafa Kemal ATATÜRK. It became a

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

settled symphony orchestra in Ankara with the aim of promoting, introducing, and fostering polyphonic music in Turkey, as well as performing the works of Turkish composers abroad (Ak, 2021; "CSO Hakkında", 2022).

Due to the inadequacy of the first concert hall opened in 1960, there arose a need for a new building. In 1992, a national competition was organized, marking the beginning of the project and construction process for the new concert hall (bi-özet, 2020).

Figure 1. First Concert Hall (SALT Archive)

The Presidential Symphony Orchestra Concert Hall was born as a result of the quest for a concert hall befitting the capital of the Republic of Turkey. Just as the Sydney Opera House represents the city of Sydney and Australia on a global scale, it was believed that an iconic and symbolic structure was necessary. To undertake this prestigious project, a national architectural design competition was organized in 1992. The project, designed by Semra UYGUR and Özcan UYGUR, received the first prize among 46 competing projects.

The concert hall has been designed as a composition formed by the combination of earth, water, and green elements. The concert halls, foyer, and other units of the complex are planned to be enclosed by an artificial lake. The masses of the concert halls and the foyer are compressed and interconnected, creating a closed valley. The transparent foyer mass rising from within the lake between the concert halls marks the axis between two significant landmarks of Ankara, Anıtkabir and Ankara Castle. All geometric forms exist as a product of a symbolic approach.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 2. Presidential Symphony Orchestra Concert Hall and Choral Rehearsal Building. view from the foyer mass towards the axis of Ankara Castle. (Arkitera Archive)

The construction of the building utilized the pneumatic (membrane) formwork technique due to the unique shapes of the structures, namely, ellipsoidal (egg-shaped) and spherical halls. This structural system was used for the first time in Turkey. It was executed by Turkish engineers and workers under the supervision of an American company. After placing the membrane on the foundation, it was inflated with compressed air. Subsequently, polyurethane was sprayed inside the formwork for insulation, and "shotcrete" was applied to the exterior of the formwork. The thickness of the concrete in the ellipsoidal hall was 52 cm, while in the spherical hall, it was 30 cm, adjusted according to acoustic requirements. The use of the pneumatic formwork system for the first time in Turkey brought about implementation challenges. As a result, architectural decisions were made to ensure that the form would reach the intended shape.

Another challenge faced during the construction process was the fact that the project site was located on an old riverbed. Even during the foundation pouring, there were rises of up to 1 meter in the foundation due to underground water. However, especially during the project's suspension, no intervention was made, causing the construction site to be submerged underwater. Due to a lack of planning and demand, the construction progress proceeded unusually slowly, and after excavation work in 2004, when construction was halted for an extended period, the underground water beneath the site turned into a lake.

All these challenges were overcome through the design decisions made. This complex, with a total construction area of 62,547 square meters, has opened its doors after a 29-year journey as a new venue for lovers of Symphonic Music, Turkish Classical Music, Turkish Folk Music, Polyphonic Choir, and Folk Dances, and it is now actively serving the community.

2. MATERIALS and METHODS

In this study, interviews were conducted with the architects of the project, Semra UYGUR and Özcan UYGUR, their daughter Deniz UYGUR, who is also an architect, and the construction site supervisor Vedat OĞUZMAN through written and verbal channels. Additionally, as a result of these interviews, printed resources archived by the project architects were shared with me.

III. International Architectural Sciences and Applications Symposium **September 14-15, 2023, Naples, Italy**

This research, while conducting the examination, presents the problems encountered during the process and the architectural solutions developed, incorporating evidence obtained from reports, personal correspondence, and questions conveyed via email, newspapers, and magazine articles.

3. FINDINGS and DISCUSSION

The full name of the building is "Atatürk Cultural Center Presidential Symphony Orchestra and Choir Rehearsal Buildings," commonly known as CSO. It was conceived as a prestigious structure to be built within the Atatürk Cultural Center Complex and was opened to architectural ideas through a national competition organized in 1991 under the auspices of the Ministry of Public Works and Settlement of the Republic of Turkey (now known as the Ministry of Environment, Urban Planning, and Climate Change).

In commemoration of the 100th anniversary of the birth of the founder of the Republic, Atatürk, and as a symbol of the Republic, a decision was made to construct an Atatürk Cultural Center Complex. To enable the construction of the complex, Law No. 2302 was enacted on September 23, 1980. This law defined the boundaries of the Atatürk Cultural Center area.

The boundaries of this area consist of 5 zones as indicated in the diagram included in Law No. 2302's annex. The decision and authority for the construction of all buildings within the Atatürk Cultural Center area were granted to the National Committee. The "1/5000 Scale Atatürk Cultural Center Area Master Plan," approved by the Ministry of Environment, Urbanization, and Climate Change of the Republic of Turkey in 2001, is in accordance with the form deemed appropriate by the National Committee within the Presidency.

In this plan, the 1st Zone is designated as a "Culture and Recreation Area," encompassing the Old Hippodrome Area and the Atatürk Cultural Center Building, along with the unused State Opera and Theater Building and Congress Complex Project. The 2nd Zone in the plan is identified as a "Sports Area," housing the 19 May Stadium, Atatürk Indoor Sports Hall, and Arena Indoor Sports Hall. The 3rd Zone covers the Youth Park area and is designated as a "Culture and Entertainment Area."

The 4th Zone is categorized as an "Artistic and Cultural Area," containing the Presidential Symphony Orchestra building and other facilities such as the CerModern art gallery, which has been restored by Semra UYGUR and Özcan UYGUR, and the Selim Sırrı Tercan Sports Hall. The final zone, the 5th Zone, is designated as a "Historical Area." In this zone, the Republic Museum, the Independence War Museum, and the first and second Parliamentary buildings, located between Ulus Square and Youth Park, are situated.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 3. Atatürk Cultural Center area region boundaries. (Ministry of Environment, Urbanization, and Climate Change, Republic of Turkey, 2014)

By the decision of the National Committee dated December 14, 1990, the project to design the Presidential Symphony Orchestra Concert Hall, Multipurpose Halls, and working spaces for Turkish Classical Music in the 4th Zone of the Atatürk Cultural Center area was assigned to the Ministry of Public Works and Settlement.

Subsequently, the Ministry of Public Works and Settlement organized a national, single-stage design competition to obtain the projects for the Presidential Symphony Orchestra Concert Hall and Chorus Working Buildings. The jury members for this competition were prominent architects of their time, including Orhan DİNÇ, Doğan TEKELİ, İlhami URAL, Nejat ERSİN, Doruk PAMİR, and Umur ERKMAN, along with Civil Engineer Ali TERZİBAŞOĞLU. The specifications prepared by the jury members were comprehensive, providing a thorough overview of both the program and the data related to the location.

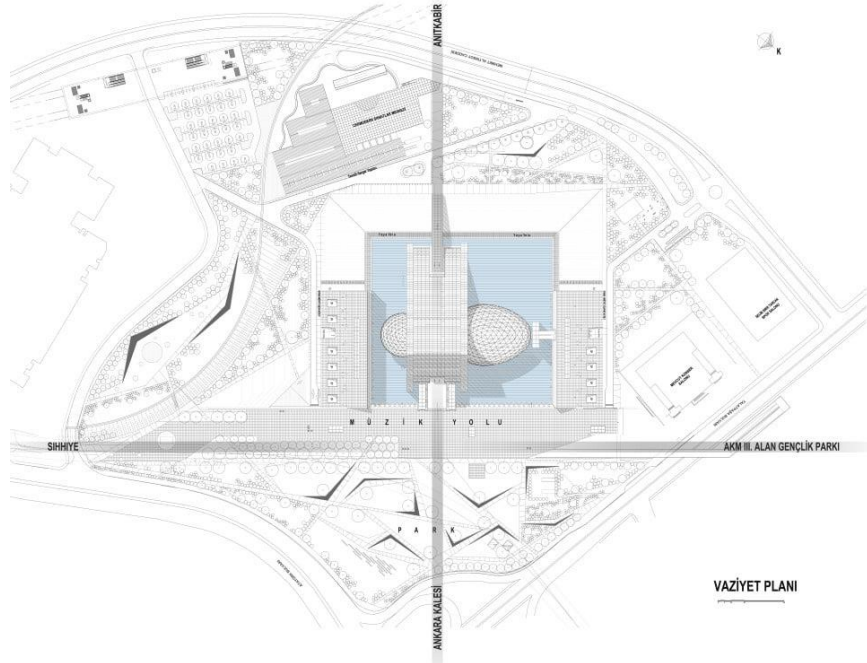

Figure 4. Site plan. (Uygur Architecture Archive)

"As a competition brief, I believe that it is still the best competition specification we have ever encountered, even though 30 years have passed since then. This is because the competition brief clearly and explicitly articulated what was expected in terms of the city and the building."

Semra UYGUR

The most crucial element we need to address first when discussing the competition is the competition brief. As conveyed by the project's architects, the competition brief for the Atatürk Cultural Center Presidential Symphony Orchestra and Chorus Working Buildings (See Appendix-1) played a pivotal role in shaping the project by providing information and data about what was required. When the specification content is examined, it begins with explanations about the competition area.

According to the information presented in the specification, the 4th Zone is described as an area where Atatürk Boulevard, which predominantly serves as a protocol road in Ankara, intersects and offers the most beautiful perspective of Anıtkabir. Furthermore, in this regard, it is recommended that the development in this area should consider leaving green buffer zones towards the direction of the Palace of Justice and the traffic intersection, with the sports hall and the area near the old CSO building in mind. Ensuring continuity between the Youth Park green area and the green areas to be arranged in the 4th Zone is also suggested.

"This actually indicates the expectation of green area and pedestrian pathway connectivity in Ankara."

Semra Uygur

In the competition, it was stated that the main objective was to find the conceptual ideas for a structure that would symbolize the contribution of the Republic of Turkey to "Universal

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Culture" and reflect the current level of "Turkish Architectural Art." It was aimed to create a contemporary and enduring cultural monument while also promoting the fine arts.

In terms of massing, the design of the concert hall and chorus working buildings, either as separate masses or together, with an emphasis on their ability to function independently, was left to the discretion of the participants, taking into consideration their relationships with the surroundings and urban data. Additionally, even for the parking facilities, it was suggested that they should be designed in a capacity and form that could meet the needs of the immediate environment, including both open and closed, limited, and general-purpose areas when necessary. It was also specified that the entrances to the service and parking areas should be provided from Talatpaşa Boulevard via the road that surrounds the competition area along the railway on the western side.

Subsequently, the competition requirements were detailed. Participants were requested to provide a site plan, floor plans, sections, elevations, a model, perspectives, an architectural description report, a civil engineering description report, a mechanical engineering description report, an electrical engineering description report, and an acoustic report. Each of these documents was specified with its details.

Some of the important points regarding these documents included the requirement to show prevailing wind, landscape, and north direction indicators in the same location collectively on the site plan. The existing conditions (boundaries, roads, etc.) were to be depicted as zoning lines, and the total construction area was to be written in a suitable place on the sheet.

For the floor plans, they requested that the outer dimensions be shown towards the outer building façade, with block dimensions on the first line and load-bearing axes on the second line. Blocks were to be labeled, and the names and orientations of the units they contained were to be indicated. It was also specified that all buildings would be leveled with the finished floor level of the main entrance set at 0.00. Ground floor plans were to include landscaping as needed, with room names specified in writing, and even furnishings added to the spaces as deemed necessary. All of this data highlights the comprehensiveness of the specification, encompassing every detail.

The competition results, as specified in the competition brief, were determined through the jury evaluation held on October 5, 1992, and were announced in a one-day publication in Ankara and a two-day publication in Istanbul. Additionally, the jury report was sent to the relevant professional associations and to the addresses of all participants who had obtained the competition specifications.

Projects that did not win awards were returned to their respective owners. The rights to the winning projects and honorable mentions were secured by the ministry. According to the competition brief, the ministry would proceed with the implementation projects and professional supervision services for the first-place winning project if the feasibility of the first-selected project was approved by the jury.

There is a part in the competition brief that can be seen as the cause of delays in implementation. According to the specification, the commencement of the implementation project was contingent upon the project allocation being included in the annual investment program and budget. If the project allocation was not included in the annual investment program and budget, the ministry would have the discretion to decide whether or not to proceed with the

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

implementation projects. If the project allocation was included in the annual investment program and budget and the project's needs had not significantly changed, the ministry would have the implementation projects carried out by the project owner selected according to the provisions of this specification and its attachments.

According to Özcan UYGUR, the foundation of the project's backstory was laid in the Turkish architectural scene in 1991. Özcan UYGUR mentions that both the Chamber of Architects and the Turkish Association of Freelance Architects put forth significant efforts during that time, and this was widely covered, even in newspaper columns. He also emphasizes that the architectural environment of that period played a crucial role in shaping the genesis and foundation of this competition.

When they embarked on the competition, they initially conducted research to understand the conceptual landscape globally and sought inspiration from two projects that particularly influenced them on a conceptual level. The first was the International Design Competition for the Alexandria Library, and the second was the International Architectural Design Competition for the Acropolis Museum. These competitions, especially the one where Nicoletti took the first place, provided architects with valuable clues and insights for framing their ideas.

Figure 5. Sections of the Alexandria Library project. (Ragheb, 2016)

Figure 6. Sketch perspective of the Acropolis Museum project. (Uygur Architecture Archive)

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

During the period when the competition was launched, the area was being used as subway construction sites. This area later encompassed a total of 145 acres, including the Cer Workshops, for which Uygur Architecture conducted restoration work.

Semra UYGUR mentioned that during the period when the competition was initiated, the area was being used as subway construction sites. This area later encompassed a total of 145 acres, including the railroad yard, for which Uygur Architecture conducted restoration work. When looking at a 1/5000 scale map, they realized that the area was situated at a point where it connected the axis between Anıtkabir and Ankara Castle. They emphasized that this realization was crucial in establishing the relationship between what was required in the competition brief.

When they realized this, they wondered whether the orientation of Anıtkabir towards Ankara Castle was accidental. They mentioned that in the Anıtkabir library, they found a typewritten and handwritten note-covered unpublished book draft by Orhan ARDA, recounting the story of the construction of Anıtkabir. They were allowed to make photocopies of it. Upon reading it, they learned that the specific orientation of Anıtkabir's mausoleum towards Ankara Castle axis was a recommendation from the jury members, particularly Paul Bonatz's suggestion. During its construction, Orhan ARDA and Emin ONAT had adjusted the mausoleum in this direction while preparing the implementation projects based on this recommendation.

"One day, I will surely die; my nation can bury me wherever they wish. However, I would like to see a glorious Turkish flag waving in front of my grave at all times."

Mustafa Kemal ATATÜRK

Despite the minarets of the Melike Hatun Mosque in Ulus today obstructing the line of sight, the window in Atatürk's mausoleum precisely frames the Turkish flag waving atop Ankara Castle. According to Semra UYGUR, this piece of information held great significance for them.

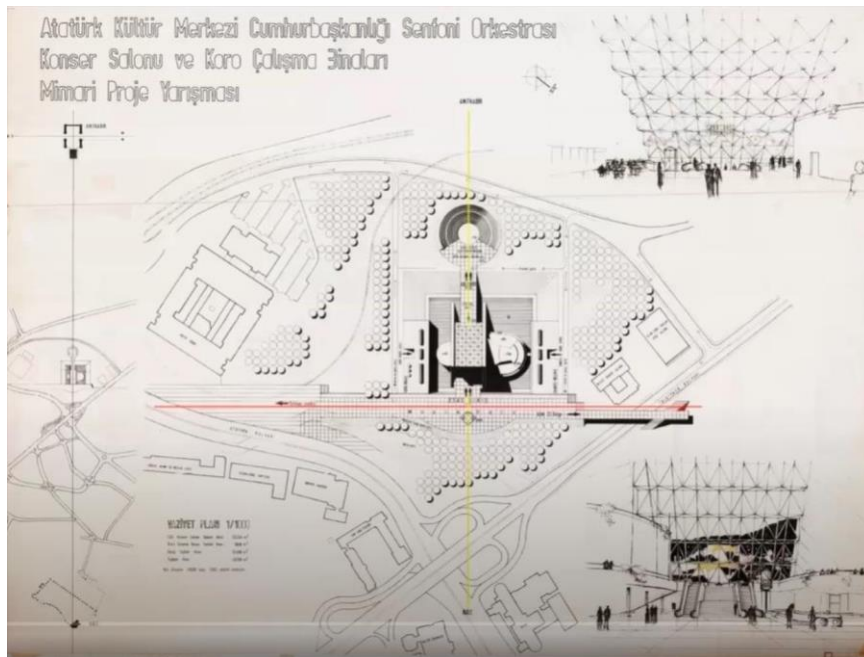

Figure 7. Competition 1st sheet. (Uygur Architecture Archive)

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

In the first sheet of the competition, the yellow axis is marked as the axis connecting Anıtkabir to Ankara Castle. On the other hand, the red axis signifies the physical connection of Atatürk Boulevard mentioned in the competition specifications to Gençlik Park through the bridge over Talatpaşa Boulevard, as requested.

The content of the competition includes a 2000-seat concert hall and a 500-seat chamber music hall. On the right side, there are office units for the Presidential Symphony Orchestra staff. On the left side, choir workspaces have been provided, including Turkish folk music, Turkish classical music, polyphonic choir, and Turkish folk dance.

The concept here is to create a stopover point at the point where the castle and Anıtkabir face each other while fulfilling these functions, to unite the areas of the Atatürk Cultural Center, and to establish tranquil, serene, self-contained workspaces around a crater lake within these areas.

"... This proposal is conceived as a step that connects the Atatürk Cultural Center areas. In the competition area, which is the only open space on Atatürk Boulevard providing perspective to Anıtkabir, a music center has been designed that harmonizes with earth, water, and greenery (without compromising this view and losing the structure)."

Architectural Description Report

In order to accomplish this task, the building has been lowered by 8 meters from Atatürk Boulevard. This way, the building could make itself visible, and the visibility of Anıtkabir from Atatürk Boulevard has not been obstructed.

"The halls and foyer have been preserved within a crater lake, framed by the complex's other units and the surrounding terrain. ... With the rise of the foyer's central Euclidean and iconic form, this cluster of buildings joins in the dialogue between Anıtkabir and the Castle. The main mass of the concert hall legitimizes its presence within the crater lake and lifts its head as if to say, 'I am here.' The visual impact of the structure, surrounded by water, is enhanced by reflections.

This designed music center is a meaningful urban space that acknowledges and contributes to the deliberate dialogue between Anıtkabir and the Castle through architectural design decisions."

Architectural Description Report

At this point, it is necessary to mention the jury members. The competition was evaluated by a jury consisting of prominent figures in Turkey at that time. The jury panel, chaired by Doğan TEKELİ, included Orhan DİNÇ, Nejat ERSİN, Doruk PAMİR, Ali TERZİBAŞOĞLU, İlhami URAL, and Nuran ÜNSAL.

The report on the project selected by the majority vote of the jury includes the following notes:

"... The proposed project has approached the task not as a structure with a design language that could be valid for a specific time period but as a city-scale, enduring symbolic gesture, making it stand out with this attitude. ..."

The timeless design approach that also contributed to the prominence of the project, as mentioned by the jury members, has ensured that the construction, which took 28 years, as the jury members have stated, never becomes outdated.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 8. Competition model. (Uygur Architecture Archive)

During the implementation project phase, the idea of separating and distinguishing the adjacent masses of the building located at the lowest level of the region was developed. The circularly shaped flat-roofed cylindrical masses in the competition project have been replaced by two independent shells in the form of an egg and a sphere.

Figure 9. Competition model. (Uygur Architecture Archive)

After extensive work, the concrete shell structures of the Symphony Orchestra Concert Hall and Chamber Music Concert Halls, which are unique in the world, are constructed in Turkey for the first time using a pneumatic formwork system.

Along with the shell forms, the layout of the concert hall, which was deemed acoustically insufficient in the jury report and requested to be redesigned, has also been updated. At this stage, the architects mentioned that they took inspiration from the Berlin Philharmonic Orchestra Building and believed that the hall had a shape similar to an egg. They worked in collaboration with an acoustic consultant and determined that the egg shape was the most acoustically optimal form.

September 14-15, 2023, Naples, Italy

Figure 10. Construction site photograph. pneumatic formwork. (Uygur Architecture Archive)

Figure 10. Construction site photograph. from inside a pneumatic mold. Concrete shell formation using spray technique. (Uygur Architecture Archive)

The project, which began with an architectural design competition in 1992, was awarded a contract in 1995 before the design was fully completed. Consequently, the construction complex, whose foundation was laid in 1997, was repeatedly postponed until 2014 due to insufficient funding. Due to a lack of planning and demand, the construction progress proceeded at an unusually slow pace. In 2004, after excavation work, the construction was halted for an extended period, and the underground water beneath the site turned it into a lake.

September 14-15, 2023, Naples, Italy

Figure 11. Groundwater resurfacing during the pause period. (Uygun Architecture Archive)

Figure 11. Groundwater resurfacing during the pause period (Uygun Architecture Archive)

Thanks to the personal efforts of the Minister of Culture at the time, the construction site, which had come to life in 2008, made significant progress even with limited funding for about 5 years. However, in 2014, with the depletion of all funds, the construction site fell into a deep slumber lasting for 3 years.

The construction, which had its turnkey tender in 2017, was rushed to completion at a rapid pace. However, this complex, which had been neglected by bureaucrats for almost 30 years, was turned into promotional material when it reached the final stretch. It was attempted to be opened hastily without completing the fine work, acoustic tests, and landscaping project. The facility announced to the public on December 3, 2020, was opened as if it were finished. Subsequently, it was closed, citing the pandemic, and construction continued.

During this 29-year period, there were changes in leadership with 5 Presidents, 10 Prime Ministers, and 20 Ministers of Culture.

4. CONCLUSION and RECOMMENDATIONS

Within the scope of the Master of Architecture at Başkent University's Department of Architecture, the course with the code MIM531, titled "Special Topics in Architecture,"

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

explores the stories of projects constructed as a result of architectural design competitions. In this context, the report examines the National Architectural Design Competition for the Presidential Symphony Orchestra and Chorus Working Buildings, which is also known as the Atatürk Cultural Center. The report delves into the competition process of the project and the subsequent 28-year construction period, investigating the challenges encountered during this period and how these challenges were overcome through design decisions.

From the moment Semra UYGUR and Özcan UYGUR's project was selected as the winner, it took five years before construction began on the Atatürk Cultural Center, Presidential Symphony Orchestra, and Chorus Working Buildings. During the implementation phase, the project changed, resulting in its current form. Although no revisions were requested, the architects made changes to enhance the project. According to the architects, this period was a time when they questioned themselves, wondering if "could it have been better," and they made revisions to what they could.

A groundbreaking decision was made in Turkey, where a pneumatic formwork system was used to construct the concert hall masses. Since this was the first time such a method was attempted in Turkey, the contracting company sought consultancy from an experienced American firm. However, the project progressed with highly skilled Turkish engineers and workers. Moreover, using this method, the egg-shaped three-dimensional structure quickly took shape. While the architects claimed there were no issues, Vedat OĞUZMAN, the site manager, noted that due to the massive size of the structure, there were deformations in its form during the construction process. Three-dimensional scans were conducted, precise measurements were made with machines working by point cloud, and substantial amounts were spent. The existing structure was scanned and digitized, revealing a subtle 1.5-meter depression on top of the sphere, which was difficult to perceive due to the weight of the concrete. When there was a downward sag, it was observed that there was an inflation of 30-40 cm on the sides.

In the competition project, the cladding of the concert hall masses was designed to be stainless steel, but it was foreseen that the cladding, which was planned to be curved from three layers, would pose problems during production due to its large size. Therefore, "flat" frosted glass, which was manufactured in dimensions that would not alter the egg and sphere qualities, was used instead. Each glass size was determined individually through parametric work. Then, by adjusting the leg lengths of the facade's construction, the 1.5-meter difference was bridged, and the desired form of the structure was achieved.

Another challenge during the construction process was the fact that the project was situated on the site of an old riverbed. Even during foundation pouring, elevations of up to 1 meter were observed in the foundation due to groundwater. However, especially during the project's suspension, the site could not be intervened, resulting in the construction site being submerged in water.

All of these challenges were resolved through design decisions. This complex, with a total construction area of 62,547 square meters, serves as a new working and meeting point for lovers of Symphonic Music, Turkish Classical Music, Turkish Folk Music, Polyphonic Choir, and Folk Dances, following a 29-year journey, and is now actively in service.

SUGGESTIONS FOR HOSPITALS' INTERIOR DESIGN STRATEGIES WITH EVIDENCE-BASED DESIGN (EBD) APPROACH: PATIENTS POINT OF VIEW

Assist. Prof. Dr. Şevkiye Merve Taşoz (ORCID: 0000-0001-5213-5079)
Bahçeşehir University, Faculty of Architecture and Design, Department of Interior
Architecture and Environmental Design, İstanbul-Türkiye
Email: sevkijemerve.tasoz@bau.edu.tr

ABSTRACT

This research aims to study hospital design strategies with an Evidence-Based Design (EBD) approach and to suggest a method to create an efficient design guideline for the interior architecture field. For the interior architecture field, user's needs, attributes, and desires are the focal issues. This research is focusing on patients as a target user group. Patients' perceived quality of care depending on the design strategies of the hospitals will be considered in the guideline method suggestion. This study is review-based and it is conducted to evaluate the evidence for healing properties of hospital environments focused on key interior design features of hospital buildings such as; infection control (materials), reducing noise levels, improved wayfinding, improved thermal comfort, improved visual comfort, improved physical comfort, access to nature and future based design considerations etc. These features are categorized under five criteria according to affinity diagramming; safety issues, comfort issues, accessibility issues, social issues, nature related issues. EBD has a significant role in the planning and design of hospitals as a result, this study contributes to the field since it suggests a guideline after discussing all related literature deeply. The Systems Research Organizing Model (SROM) is used for creating the design guideline by considering the decision-making process.

Keywords: Evidence-Based Design (EBD), Healing Properties of Hospital Environments, Person-Environment Relationship, Affinity Diagramming, Systems Research Organizing Model.

1. INTRODUCTION

As part of hospital design's planning process, there is a rising demand for Evidence-Based Design (EBD) concepts that are effective in patient care in terms of "healing environments". However, the criteria are not fully stated as a guideline for interior architects, architects, and designers for efficient use of EBD features in hospital design to enhance person-environment relationships and allow hospitals to be healing environments for patients. This study is aimed to be a unique and contributive study in terms of defining the EBD features in the decision-making process of design under five main categories; safety issues, comfort issues, accessibility issues, social issues, and nature-related issues by using a descriptive study based on affinity diagramming of literature review and open-ended questions based interview with 30 participants.

Problem Statement:

As part of hospital design's planning process, there is a rising demand for EBD concepts that are evidently effective on patient care in terms of "healing environments". However, the criteria are not fully stated as a guideline for interior architects, architects and designers for efficient

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

use of EBD features in hospital design to enhance person-environment relationships and allow hospitals to be healing environments for patients. This study is unique and contributive in terms of defining the EBD features in the decision-making process of design under three main categories; safety, comfort, and accessibility by using a descriptive study based on affinity diagramming of literature review. This study focuses on patients' points of view however, medical staff, administrative staff, and visitors are also other target user groups and in future studies, it will contribute to focus on these user groups as well.

2. MATERIALS and METHODS

Evidence Based Design (EBD)?

EBD is a scientific approach that focuses on the use of data acquired in order to influence the design process in healthcare facilities like hospitals. EBD aims to measure the physical and psychological effects of the built environment on its users (Zimrig et. al., 2008). EBD is an influential approach on person-environment relationship especially in healthcare design field. EBD is an approach to create efficient healing environments for healthcare facilities. EBD provide the focus on how designs can be best utilized to help patients recovery while providing safe environment for the staff allowing them perform better (Rafeeq& Mustafa, 2021), (Ulrich, 1997). Figure 1 illustrates the EBD theoretical framework with built environment variables and the outcome from the target user's point of view.

Figure 1. The EBD theoretical framework (Taken from Ulrich, 2004).

1. Healing Environments:

According to the World Health Organization (WHO) health is not simply the absence of disease, and hospitals have a great role in enabling physical, mental and social well-being (Rafeeq& Mustafa, 2021). Healing environments are multisensory settings. They engage the physical, emotional, spiritual, and social dimensions of the individual for the purpose of restoring and maintaining health and well-being (Ulrich, 2004). The healing environment is a term used to define the parameters that have a psychological and physical effect on the healthcare community, including staff, patients, and visitors (Rafeeq & Mustafa, 2021). A healing environment maximizes an individual's control over the environment, supports one's social network (i.e., thoughtful accommodations for families and visitors), and affords unrestricted access to nature and other positive distractions (Ulrich, 2000).

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

I. Elements of EBD

- i. Connection to Nature (Windows, Skylights, Access to Garden or Terrace etc.)
- ii. Control
- iii. Acuity Adaptable Rooms
- iv. Distributed Nursing Stations
- v. Privacy (Single Patient Rooms)
- vi. Social Support
- vii. Positive Distractions (Socio-environmental Features like Music or Arts etc.)
- viii. Thermal Comfort (Air Quality etc.)
- ix. Visual Comfort
- x. Audial Comfort
- xi. Ergonomic Furniture and Arrangements (Socially Supportive, Comfortable, Flexible, etc.)
- xii. Wayfinding
- xiii. Building Layout
- xiv. Sustainable Design Features

(Huisman et al., 2012); (Jackson, 1991); (Malkin, 2008); (Mallock & Porter O'Grady, 2005); (Pati et al., 2008).

II. Relationship of EBD and Healing in Healthcare Design

Healthcare designers need to acknowledge that the main need for comfort is the critical path on the patient journey (Verdel & Todd, 2012). The need to provide an environment that makes the patient feel that they have privacy, a sense of security, safety, social area, and personal space. With EBD in the interior design process, the person-environment relationship is enhanced in hospital environments (Rafeeq & Mustafa, 2021).

- i. Person (Patient)-Environment (Healthcare Facility) Relationship
- ii. Reduced Pain
- iii. Reduced Stress
- iv. Reduced Depression
- v. Rapid Healing Process
- vi. Lower Medication Intake
- vii. Reduced Mortality
- viii. Improved Sleep Patterns
- ix. Improved Patient Experience

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

III. EBD and Hospital Design

Hospices, elder care institutions, and hospitals are considered healthcare facilities. In this study, the focus is on hospital design. Hospitals are in general stressful places for patients and visitors mainly due to fear of death, pain, and noise. Therefore, providing a better healing environment would help them relieve the stress and would also improve the outcome (Verran et. al., 2012). This makes hospital design a complex mission that is not only limited to functional aspects but also encompasses physiological and social aspects. This task might be more critical when the design targets patients with restricted mobility.

3. Suggested Methods and Findings for Guideline Formation Process

Affinity Diagramming of Literature and Interview:

Japanese anthropologist Kawakita Jiro evolved the affinity diagram in the 1960s. The main aim of an affinity diagram is to generate, organize, and consolidate information concerning a product, process or design problem. Constructing an affinity diagram is a creative process that expresses ideas without quantifying them. The affinity diagram helps a group to develop its own system of thought about a complex issue or design problem. Table 1 shows the five categories; safety issues, comfort issues, accessibility issues, social issues and nature related issues and the related interior design features according to the affinity diagramming of the literature.

Table 1. Affinity diagramming of EBD for hospital design

DESIGN ISSUE CATEGORY	FEATURE 1	FEATURE 2	FEATURE 3	FEATURE 4	FEATURE 5	FEATURE 6	FEATURE 7
SAFETY ISSUES	Ergonomic Furniture	Acuity Adaptable Rooms	Wayfinding	Efficient Building Layout	Distributed Nursing Stations	Control	
COMFORT ISSUES	Ergonomic Furniture	Acuity Adaptable Rooms	Privacy	Social Support	Thermal Comfort	Visual Comfort	Audial Comfort
ACCESSIBILITY ISSUES	Efficient Furniture Arrangement	Efficient Vertical Circulation	Efficient Horizontal Circulation				
NATURE ISSUES	Openings like Windows, Skylights etc.	Access to Terrace, Balcony, Garden etc.	Sustainable Design Features				
SOCIAL ISSUES	Waiting Lounge etc. Public Areas	Social Distractions like Music, Arts etc.	Socio-et al Furniture Arrangements				

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Table 2. Participants of the selected hospital design

DEMOGRAPHICS	PATIENTS WITH CANCER DISEASE	PATIENT WITH COPD DISEASE	PATIENT WITH CARDIOVASCULAR DISEASE
Gender			
<i>Female</i>	5	5	7
<i>Male</i>	3	6	8
Age			
<i>18-24</i>	1	0	0
<i>25-34</i>	0	0	0
<i>35-44</i>	1	0	2
<i>45-54</i>	3	0	4
<i>55-64</i>	1	3	4
<i>65 and over</i>	2	8	5
Highest Level of Education			
<i>Middle School</i>	0	0	0
<i>High School</i>	3	7	6
<i>Undergraduate Degree</i>	4	4	7
<i>Graduate Degree</i>	1	0	2
Months of Treatment			
<i>Maximum</i>	26	38	52
<i>Minimum</i>	2	1	4
<i>Mean</i>	9.2	11.2	22.4

In this study affinity diagram is first used to categorize the interior design features of hospitals in terms of EBD. Then the second phase was to add the interior design features found in the interview with 30 participants related to hospital design. The interview was done in a hospital in Maltepe, İstanbul. All participants have some chronic diseases like cancer, chronic obstructive pulmonary disease (COPD) and cardiovascular diseases which means that they visit the hospital environment frequently. However, none of these diseases affect cognitive abilities so, that is why the demographic information is as shown in Table 2. Also, all participants have a minimum high school degree as an educational background.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

As shown in Table 3, after the interviews, the interior design features are increased. Since the target user group is hospital patients, their additions to literature review is very significant. The interview-based additions are shown in red color. The open-ended questions that lead the interview are;

1. Which design features will allow you to feel more safe?
2. Which design features will allow you to feel more comfortable?
3. Which design features will allow you to be more social?
4. Which design features will allow you to have a better mood?
5. Which design features of a hospital make you feel less stressed?
6. What is the most significant design issue during your hospital visits?
7. What is the most significant design issue if you need to stay in a hospital room?
8. Which design features or lack of design features make you feel nervous?

Table 3. Affinity diagramming of EBD for hospital design with the addition of interview results

DESIGN ISSUE CATEGORY	FEATURE 1	FEATURE 2	FEATURE 3	FEATURE 4	FEATURE 5	FEATURE 6	FEATURE 7	FEATURE 8
SAFETY ISSUES	Ergonomic Furniture	Acuity Adaptable Rooms	Wayfinding	Efficient Building Layout	Distributed Nursing Stations	Control		
COMFORT ISSUES	Ergonomic Furniture	Acuity Adaptable Rooms	Privacy	Social Support	Thermal Comfort	Visual Comfort Colors	Audial Comfort	Home-like
ACCESSIBILITY ISSUES	Efficient Furniture Arrangement	Efficient Vertical Circulation	Efficient Horizontal Circulation	Reachable Information Desk	Legibility	Non-slip Floor Materials	Handrails and Bars	Elderly-Friendly
NATURE ISSUES	Openings like Windows, Skylights etc.	Access to Terrace, Balcony, Garden etc.	Sustainable Design Features					
SOCIAL ISSUES	Waiting Lounge etc. Public Areas	Social Distractions like Music, Arts etc.	Socio-et al Furniture Arrangements	Atmosphere	Dignity			

As can be seen in the table there are new interior design features that are suggested by hospital patients. Their suggestions are also added because the focal point is target users' desires, attributes and comfort.

1. Reachable Information Desk (3 Participants)

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

2. Atmosphere More Than a Hospital; Gift Shops, Flower Shops Etc. (2 Participants)
3. Dignity (12 Participants)
4. Homelike Environment (16 Participants)
5. Legibility of Place (12 Participants)
6. Non-slip Flooring (22 Participants)
7. Handle Bars (25 Participants)
8. Colors (25 Participants)
9. Elderly Friendly (18 Participants)

Decision Making Process in Design for Hospital Design

Developing a design guideline should be valid and efficient (AIA, 2006). For this reason, for the study some developed methods are used such as; decision making process and Systems Research Organizing Model (SROM).

1. Surveying
2. Investigating alternative course of action
3. Assimilating new information
4. Strengths, weaknesses, opportunities and threads (SWOT) analysis
5. Developing a plan
6. Developing a concept
7. Developing the design process
8. Expert judgement/consultation
9. Embodiment
10. Finalization

The process is illustrated in Figure 2.

Figure 2. Design development process stages and sub-stages (Figure 2 is Drawn by the Author).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Systems Research Organizing Model (SROM)

Systems Research Organizing Model (SROM) is a fully justified model with four main elements: client, context, action focus, and outcomes. Feedback loops in the model reflect the interrelatedness of the core constructs and recognize the complex nature of the healthcare environment. It is a valuable tool for EBD by making sense of what is already known, providing a framework for future studies and synthesizing multiple studies to guide application to practice. Figure 3 illustrates the Interacting Constructs of SROM and Figure 4 shows SROM for this study.

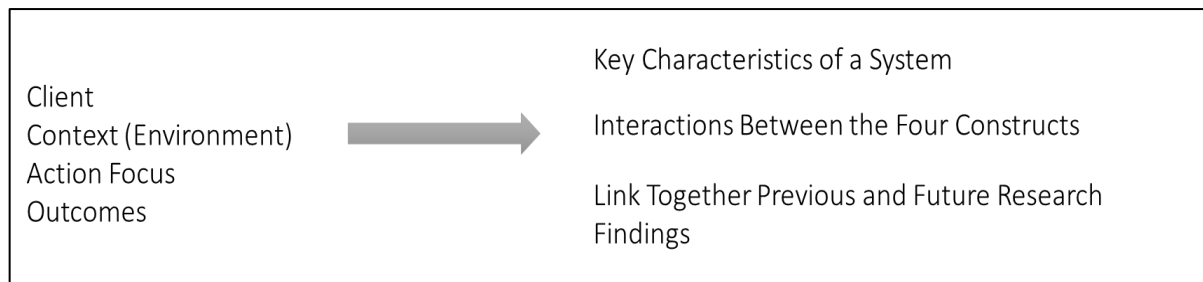

Figure 3. The Interacting Constructs of SROM (Drawn by the author).

Figure 4. System Research Organization Model for EBD in hospital design process (Figure 3 is Drawn by the Author)

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Person-Environment Relationship (Fit)

This study aims to suggest an efficient and valid process for guideline formation and while doing so, it is intended to obtain a personal environment fit with EBD design features so that hospital environments can be healing environments. The person-environment relationship (fit) proposed by Murrell and Norris (1983) defined quality of life as the criterion for establishing relationship between the person and his or her environment and, in one sense, represents a marriage between objective and subjective indicators of quality of life (Wang and Klassen, 2021). Figure 5 illustrates a person environment relationship with its influences.

Figure 5. Person-environment relationship (Figure 5 is Taken from Holland, 1997)

4. DISCUSSIONS and RECOMMENDATIONS

In our recent life, healthcare facilities including hospital environments have not been designed efficiently with EBD approach. However, it is clear that with EBD approach hospital environments are more effective in terms of healing. For efficient healing environments with EBD approach hospital environments should be designed with some guidelines. This study is a preliminary study with initial suggestions and observations. Later on with more additions to the methodology this study might lead to an efficient and valid guideline formation and it can be used in the hospital design industry to have a better person-environment fit and healing environment accordingly.

ABSTRACT

Beykoz and Hidiv Pavilion Groves, which are out of the historical groves on the Anatolian side of İstanbul, constitute the research areas of this study. Both of these groves are located within the border of the Beykoz District in İstanbul, and they overlook the Bosphorus. Since the forest ecosystems primarily dominate these groves, and accordingly these ecosystems are under the common threats of today's metropolitans such as urban sprawl, population, and social pressure, sustainable land use plans that equally take user and ecosystem sensitivities into account, should be proposed for them. Therefore, user surveys on these groves must target not only improving their recreation potential but also sustaining their ecosystem protection. Hence, this study intends to find out the proposals for the sake of possible alternative, yet sustainable land uses for recreation and conservation within these Beykoz and Hidiv Groves by referring to the visitor survey. The survey form questioned the visitors' comprehension, preferences, sensitivity, and suggestions on the groves based on their gender, age, education, livelihood, income, time spent in İstanbul, and distance to grove, groups. According to the survey with 113 persons, the "pavilion and restaurant" was primarily regarded as the focal point with the highest (44%) consent whereas the "green texture and nature" of the groves was their most attractive characteristic (with 53% acceptance). However, primarily "picnic, snack bar and tea garden" was highly proposed as an alternative recreation opportunity with 32% offering by those visitors. Nonetheless, "restaurants and cafeterias" were found the most adequate (with 41% satisfaction) by those visitors whereas they suggested "prayer, ablution and baby care rooms" and "book reading room" were suggested to be built with 19% and 17% advices respectively. On the other hand, the visitors (27% and 29%) insisted on "banning any further constructions except the walking pavements" and "banning all activities that will harm vegetation" respectively. They (28%) also stated to "ban any logging and mis-intervention to monumental trees" to prevent any further hazards within the groves. The survey overall proposed to introduce basic recreation opportunities and human necessities without increasing constructions and harming the environment for sustainable land use planning within the groves.

1. INTRODUCTION

Urban parks, which are generally evaluated within the context of urban forests (Forrest & Konijnendijk, 2005), invite the urban public and visitors to a relatively natural environment. These urban parks, sometimes in the form of forests and groves, frequently offer recreation for those people (Öztürk & Ağırtaş, 2020). Occasionally composing the trees and shrubs with the structural elements, urban forests, and groves serve the urban public and visitors by providing variable opportunities. Thus, principally they provide an aesthetic appearance (Gunnarsson et al., 2017), may lead guests to their interior destination, may supply shadow against direct sunlight (Zhang et al. 2013), also may isolate and confine separate guests. On the other hand, the groves particularly within the metropolitan cities, are very significant in terms of not only maintaining urban greenery percentage but also ensuring services of their ecosystems to the urban public. Groves that are large enough or sufficient in number to include different land use alternatives decorated with associated necessary buildings, will serve, entertain, and to some extent meet even the needs of a crowded urban population (Köse et al., 2023). However, the quantitative and qualitative sustainability of these groves must be secured for the physical and mental well-being of society (Mahmoud, 2011) as well as for conserving the urban natural environment. On the other side, urban groves, forests, and parks are under the threat of urban sprawl due to the increase in the population particularly within the metropolitan cities (Arshad et al., 2022). Therefore, shrinking and limited urban groves, forests, parks, and associated natural ecosystems will unavoidably be far from supplying recreation services that will meet the increasing demands of these populated modern societies within those metropolitan areas in particular (Mascarenhas et al., 2019). Among those urban groves, forests, and parks of metropolitan cities, İstanbul home to many urban groves, forests, and parks, some of which are historical and therefore host to many monumental trees (İMM, 2014).

Out of the historical groves on the Anatolian side of İstanbul, Beykoz and Hıdiv Pavilion Groves, which are host to monumental trees, constitute the research areas of this study. They are located within the border of the Beykoz District in İstanbul. Both of them involve spectacular landscapes and sceneries, which overlook directly the Bosphorus. These groves are dominated primarily by the forest ecosystems, which include diverse coniferous, evergreen, and deciduous tree and shrub species. Accordingly, urban sprawl, population increase, and social pressure also threaten these metropolitan ecosystems. Thus, sustainable land use plans should be proposed for them. However, these sustainable land use plans should equally take the user and ecosystem sensitivities into account. Otherwise, the user preferences regardless of conservative approaches and attitudes might lead these urban forest, grove, and park ecosystems to the risk of excessive construction in favor of meeting particularly the urgent, concrete, and physical needs of the visitors. Therefore, user surveys on these groves must target not only revealing, realizing, and improving the opportunities of their recreation potential and services but also sustaining their ecosystem protection.

Hence, by referring to a visitor survey, this study intends to find out and develop sustainable land use plans and proposals for these Beykoz and Hıdiv Pavilion groves. In this way, truly necessary recreation opportunities and alternatives can be suggested as well as securing the conservation of naturalness within these groves. Thereby, a survey form was prepared for the visitors not only aiming to question their awareness and satisfaction with the actual facilities and recreation services but also intending to discover their true necessities for the possible facilities and recreational opportunities. In addition, this survey form proposes to reveal and,

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

even stimulate the sensitivities of those visitors on the naturalness and preservation of the groves. Moreover, by this survey, conservative approaches and attitudes of the visitors can directly be reflected in the plans, projects, designs, and applications on these groves, and they can be represented in the act of decisions, reclamation, and management proposals for the future land uses within these groves.

2. MATERIALS AND METHODS

Site Characteristics

Figure 1. Location of Hidiv Pavilion-grove and Beykoz grove within İstanbul and Turkey

The Hidiv Pavilion and grove, which cover approximately 21.28 ha, is located between the $29^{\circ} 04' 15''$ and $29^{\circ} 04' 49''$ eastern longitudes, and between the $41^{\circ} 06' 08''$ and $41^{\circ} 06' 27''$ northern latitudes. The Beykoz grove, which covers approximately 27.85 ha, is located between the $29^{\circ} 05' 50''$ and $29^{\circ} 06' 30''$ eastern longitudes, and between the $41^{\circ} 07' 52''$ and $41^{\circ} 08' 15''$ northern latitudes (Figure 1). The altitude of the Hidiv Pavilion and grove extends from the sea level up to only 80 m asl. The altitude of the Beykoz grove extends from the sea level up to 121 m asl. İstanbul's climate is a transition between Black Sea and Mediterranean climates (Atalay, 2011). The forest ecosystem is primarily composed of stone pines (*Pinus pinea* L.), sweet chestnuts, (*Castaena sativa* Mill.), oak species (*Quercus* sp.), European hornbeams (*Carpinus betulus* L.), oriental beeches (*Fagus orientalis* Lipsky), silver lindens (*Tilia tomentosa* Moench.), oriental planes (*Platanus orientalis* L.) and black locusts (*Robinia pseudoacacia* L.) as representing dominant coniferous and deciduous trees, with oriental hornbeams (*Carpinus orientalis* Mill.),

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

strawberry trees (*Arbutus unedo* L.), Judas trees (*Cercis siliquastrum* L.), bay laurels (*Laurus nobilis* L.), and dog roses (*Rosa canina* L.) as representing dominant evergreen and deciduous shrubs (Yaltırık et al., 1997; Tarakçı et al., 2012). The limestones dominate the region's geological structure, where mainly brown forest soils have formed on (Atalay, 1982; Atalay, 2008).

Land Uses within the groves

Figure 2. Location of 16 different land uses within Hıdiv Grove

Determination of the land uses within the groves, is significant in terms of indicating the existing land use situation within these groves. Hence, their distribution in number and size can be evaluated as being data during their already management. Thus, alternative land uses and suitable areas for those alternative land uses can also be determined. Thereby, these data can be referred to for suggesting alternative land use plans and proposals when necessary. Therefore, as is presented in Figure 2, Hıdiv grove homes to 16 different land uses. These land uses consist of “main entrance”, “parking lots”, “garden market”, “construction site”, “walking trail”, “tulip statue and surroundings”, “children's playground”, “monumental tree and surroundings”,

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

“pavilion and surroundings”, “cafeterias”, “jogging and walking track”, “artificial waterfall and surroundings”, “military zone”, “viewing terrace”, “picnic site and surroundings” and “walking trail closed to vehicle traffic” (Figure 2). The land use map indicates that the constructed surfaces are relatively restricted within this Hıdiv Grove, where the pavilion stands, and represents the major building there (Figure 2).

Figure 3. Location of 32 different land uses within Beykoz Grove

On the other hand, Beykoz Grove is home to 32 different land uses which involve “coastal entrance”, “artificial waterfalls and surroundings I and II”, “walking trail”, “vehicle roads and walking pavements I and II”, “viewing terraces I and II”, “social center”, “pedestrian entrance”, “children playgrounds and surroundings I, II, III, IV, V, and VI”, “playground and recreational field”, “management and construction buildings”, “picnic sites and surroundings I, II, and III”, “entrance doors I, II, and III”, “countryside café”, “terraces”, “walking trails closed to vehicle traffic I, II, and III”, “pedestrian ways”, “parking lots”, “construction site”, “sports field” (Figure 3). The land use map indicates that the constructed surfaces are relatively more than the Hıdiv Pavilion Grove, yet they are relatively scattered within the Beykoz Grove (Figure 3).

Visitor Survey

A visitor survey was conducted with 113 persons initially questioning their gender, age, education, livelihood, and income. The survey form was attached to this study as presented in Table 1.

The survey form questioned the visitors’ comprehension, preferences, sensitivity, and suggestions on the groves regarding their gender, age, education, livelihood, income, time spent in İstanbul, and distance to grove, groups (Table 1). The form also referred to their awareness and satisfaction with the existing situation-equipment, actual facilities, and recreation opportunities (Table 1). Their approaches and attitudes towards sustainability, protection and,

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

to anticipating and avoid the possible causes of danger-threats on the groves, were also inquired (Table 1).

Table 1. Survey form for the users of Beykoz and Hidiv pavilion groves

 BARIN UNIVERSITY GRADUATE SCHOOL DEPARTMENT OF LANDSCAPE ARCHITECTURE					 ISTANBUL METROPOLITAN UNIVERSITY DEPARTMENT OF PARKS, GARDENS AND GREEN AREAS DIRECTORATE OF URBAN ECOLOGICAL SYSTEMS	
Study Subject: Development of User-Ecosystem Sensitive Proposals for Sustainable Land Use Planning in Beykoz and Hidiv Pavilion Groves						
SURVEY FORM FOR THE USERS OF BEYKOZ AND HIDIV PAVILION GROVES						
GENDER:	SIR			LADY		
AGE:	18-25	26-35	36-45	46-55	56-65	66+
EDUCATION:	Non or Dropout	Primary	Secondary	High School	University	Graduate
LIVELIHOOD:	Retired	Civil Servant	Private Sector	Rent-Property	Municipality Worker	
INCOME:	Non-Below Subsistence Wage	Subsistence Wage	Subsistence Wage-4000TL	4000-6000TL	6000-8000TL	8000TL+
ISTANBUL: How many years have you been in?	Born-Bred	0-5 Years	6-10 Years	11-20 Years	21-30 Years	31+ Years
DISTANCE TO GROVE: Where do you come from to this grove?	From Close Neighbourhood	From Close District	From Far District of Beykoz	From Different Sub-province in Anatolian Side	From European Side	Outside of Istanbul Outside of Turkey
FOCAL POINT: Where is the major focal point of the grove?	Pavilion and Restaurant	Pool and Surrounding	Waterfall and Surrounding	Walking Trail	Forest and Coppice	
MOST ATTRACTIVE CHARACTERISTIC: What is the most attractive characteristic of this grove?	Historical and Cultural Texture	Green Texture and Nature	Sea View	Social Environment and Friends	Walking and Sport Opportunity	Voices of Nature (Silent Field)
PRESENT RECREATION OPPORTUNITY: Which recreation opportunities are you aware for the grove?	Catering	Walking and Touring	Festival	Cycling and Active Sport	Art Activity	
ALTERNATIVE RECREATION OPPORTUNITY: Which recreation opportunity do you think should be introduced to the grove?	Picnic, Snack Bar and Tea Garden	Landscape Viewing and Photographing	Chess and Checkers	Event Promoting the Area and Trees	Social Facilities for Handicapped	Nature Recital and Sounds
SUFFICIENCY OF FACILITIES: Which facility do you think is most sufficient?	Restaurants and Cafeterias	Parking Lots and Car Parks	Sports and Playgrounds	Snack Bars and Markets	Recreational Areas and Surroundings	
ALTERNATIVE FACILITIES: Which facility do you think should be introduced to the grove?	Book Reading Room	Crafts Workshop and Course	Plant Introduction, Nursery and Greenhouse Course	Basketball, Football and Volleyball Field	Bicycle Track for Children, Young and Elderly	Prayer, Ablution and Baby Care Rooms
	Area Promoting Hall for Handicapped	Indoor Lounge for Seating in Rainy Weather	Countryside Wedding and Photographing Square	Gym for Handicapped	Tea and Coffee Room with Sea View	
PRESENT URBAN EQUIPMENT: Which urban equipment do you think is the most sufficient within the grove?	Lighting Equipment	Direction Boards	Sitting Benches	Groundcover Plants and Flowerpots	Protection, Blocking and Separation Fences	Table and Chair Covering Elements for Restaurant and Cafeteria
	Waste Baskets	Land Use and Reception Boards	Picnic Tables	Fountains, Shadirvans and Water Fountains	Wooden Bridges	
ALTERNATIVE URBAN EQUIPMENT: Which urban equipment do you think should be introduced to the grove?	Introducing Boards for Trees and Plants	Bicycle Park Equipment	Wrought Iron on Roadsides	Walking Paths and Ramps for Handicapped	Pergolas and Gazebos for Landscape View	Rope Climbing Equipment for Kids
	Night Lighting of Trees and Plants from Below	Changing Cabins for Sports and Activity	Separation Equipment for Vehicle and Walking Path	Audio Guidance Signs for Handicapped	Accessories for Vertical Garden and Living Wall	
PROTECTION-USE BALANCE: What is the most necessary decision and precaution to ensure the protection-use balance within the groves?	Allowing limited number of vehicles into the groves and no more parking	Allowing a limited number of people into the groves and charging entry fees for more	Limiting access to trees, flowers and grass fields	Allowing only walking paths and no more structural facilities	Increasing security personnel, equipment and activities for protection and monitoring purposes	
SUSTAINABILITY: What is the most necessary decision and precaution to ensure the sustainability within the groves?	Renewal of roads in the groves using natural materials	Conversion of grass areas into the forest understorey in the groves	Meeting water needs of the groves through economic and ecological means	Not allowing activities that will cause destruction of vegetation in the groves	Not allowing activities that will cause destruction of wildlife in the groves	
DANGER AND THREATS: Which application do you think will be the most dangerous and threatening for the groves?	Unnecessarily cutting trees from the groves and improper intervention on monumental trees	Construction of additional buildings and construction of excessively hard ground such as vehicle roads	Allowing vehicle entry and free movement into the groves beyond its capacity	Security weakness, uncontrolled entrances, and free movement in green areas	Allowing fires in picnic and outdoor seating areas	Allowing activities that will cause destruction of existing vegetation and wildlife in the groves

3.FINDINGS and DISCUSSION

According to the survey with 113 persons, about 75% of them were under 45 years old whereas 66% of them had at least high school degree. On the other hand, almost half of them had been working for a private sector with salary at least above the then subsistence wage. Besides, about 70% of them had been coming from either close or far locations of Beykoz Sub-province, İstanbul. In their study for small urban parks of Shanghai, China, Wang et al. (2021), emphasized the significance of the factors of “age”, “income”, and “distance from park” on the use of those small urban parks.

The 44% of the users; being the highest consent, regarded primarily the “pavilion and restaurant” as the focal point within the groves. However, 53% of them drew attention on the “green texture and nature” of the groves for accepting it as their most attractive characteristic. In fact, 56% of the ladies found the “green texture and nature” as the most attractive characteristic within the groves. Indeed, in their study considering six different green spaces, Ode Sang et al. (2016) reported that the ladies had preferred the urban green spaces rather than the sirs and expressed their more well-being there compared to the sirs. The 54% of the visitors stated that they were aware of the “walking and touring” recreation opportunity within the grove. On the other side, higher percentage of those visitors (with 32% consent) primarily proposed “picnic, snack bar and tea garden” as alternative recreation opportunity within the groves. Hence, the visitors from the close locations of the İstanbul highly preferred “picnic, snack bar and tea garden”. In their survey study for the urban parks of a rapidly urbanizing city of Ethiopia, Azagew and Worku (2020) indicated that the distance to the urban parks, had significant association with the frequency of park visit.

Nonetheless, the visitors found the “restaurants and cafeterias” as the most adequate (with 41% satisfaction). However, they suggested to build “prayer, ablution and baby care rooms” and “book reading room” with the advice of 19% and 17% respectively. Besides, “lighting equipment” was found as the most sufficient (with 17% satisfaction) equipment by those visitors. Moreover, they suggested to introduce “signing boards for trees and plants” and “pergolas and gazebos for landscape view” with the advice of 19% and 17% respectively. Indeed, for the users of the small park in Oslo, Norway, Nordh et al. (2011) remarked the most influence of amount and density of the grass, trees, and other people, on their choices of park alternatives. On the other hand, respectively the 27% and 29% of the visitors insisted on “banning any further constructions except the walking paths and pavements” and “banning all activities that will harm vegetation” to ensure the sustainability within the groves. For instance, for an urban park close to our study groves, Öztürk and Ağırtaş (2021) indicated that the construction interventions had led to the increased openness within the canopies of the tree and shrubs. However, 28% of the visitors also stated to “ban any logging and mis-intervention to monumental trees” in order to prevent any further hazards within the groves.

According to the overall results of this study, although half of the users declared that they had focused on the fundamental monumental buildings and, had insisted on the necessity of other structural facilities, they also admitted that they had been impressed by the greenery and nature of the groves. On the other hand, some users couldn't completely give up on the introduction of the structural facilities, demanding new structures for only other recreational and human services rather than catering. However, most of the users conceded that further intervention and

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

construction would have more or less degraded that naturalness, and therefore had suggested these interferences should have been prevented.

4. CONCLUSION and RECOMMENDATIONS

In order to secure sustainable land use planning together with the conservative applications and management within the groves, the survey results overall suggested and proposed to introduce basic recreation opportunities and human necessities without increasing constructions and buildings, and without harming the environment. Therefore, only truly necessary facilities and recreation opportunities should be included into the groves. Otherwise, unnecessary further facility applications, constructions, and buildings may lead to the capacity strain for the land uses, which then may threaten the ecosystem structure and naturalness of the groves. Thus, treating the urban forests, groves, and parks, demands sustainable approaches by implementing ecosystem conservation and restoration practices during the application of any recreational projects and facilities within them (Steiner, 1999).

Thanks, and Information Note

This study was prepared based on the draft master thesis works of Ahmed Cemal Çakmak, who is the co-author and who is the master student at the Graduate School of Bartın University. We would like to thank to the "İstanbul Metropolitan Municipality, Department of Parks, Gardens and Green Areas, Directorate of Urban Ecological Systems" for their permission and support of the surveys conducted within the Beykoz and Hıdiv Pavilion Groves.

FROM SHOWCASE TO FACADE: ADAPTATION OF SHOWCASE CONCEPTS TO STORE FACADE DESIGN

Assist. Prof. Dr. Mertcan Öztekin (ORCID: 0000-0002-6490-4557)

Yalova University, Faculty of Art and Design, Department of Interior Architecture, Yalova-Türkiye

Email: mertcan.oztekin@yalova.edu.tr

ABSTRACT

Showcases are display spaces that convey information about the stores. In addition to product display, arrangements are made in the showcases that display the store and the store's top identity with creative concepts. In today's showcase design applications, it is seen that it extends to the facade. At this stage, the interior of the showcase and the store architectural facade turn into a platform in design applications as a whole. Thus, customers' interest in the store and their general impressions about the store can be positively affected. Artistic and creative original concepts support this stage. In the study, it is seen that store façade designs have a wider impact on customer perception and experience in the retail sector with the integration of the showcase concept. In this parallel, it is analysed how the application of storefront concepts to the façade design can change customer perceptions and attitudes towards the store. Afterwards, it is discussed how to construct the shop window design at the architectural façade boundary. Combining store fronts with showcase concepts can better reflect the brand identity and thus increase the brand loyalty of customers. This study clarifies how to establish and implement an integrity with the facade while designing showcases with interior architecture discipline. With the support of literature and sample applications, the adaptation of the design concept from the showcase to the facade is reinforced.

Keywords: Showcase, Facade, Concept, Design.

1. INTRODUCTION

The retail sector is in a continuous transformation process due to rapidly changing consumer preferences and the intensity of competition. Store owners and managers have to constantly review their strategies to attract customers and increase sales. In addition to the interior design of the store, its location, and layout, the image created in the external environment undertakes a symbolic representation task. In this task, it can provide functional and social advantages to customers. The importance of the outer shell of the store emerges in inviting customers into the space by being noticed in the external environment and conveying a visual message in a fun and effective visual silhouette (Verma, 2018). In this context, the facade design of stores plays a major role in the first interaction moment. Store fronts offer important clues to potential customers about the content and spirit of the store and therefore its design can affect the success of a store.

Apart from the act of shopping, stores have features that define the brand in the external environment, display products, express brand innovations and values, and increase customer loyalty (Foncillas, 2020). Showcases can be designed not only as a display of products, but also as a work of art. This artistic approach can help the store to offer an aesthetic experience and help customers to establish an emotional connection. Nowadays, shop windows have become

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

the outward facing face of stores and have become a part of not only the products, but also the brand identity and even the narrative of a story.

As a result, it aims to be a source of inspiration for professionals in the retail sector by emphasising how showcase concepts can be applied periodically in a holistic design language with the façade and the commercial advantages of the artistic approach. In the following sections, examples of periodical showcase applications and the reflection of the artistic approach from the micro-scale showcase to the macroscale facade are discussed.

2. MATERIALS and METHODS

In this study, the conceptual equivalents of showcases and mobiles are discussed and the micro-macro design approach is discussed with literature supports and inferences. This qualitative study describes the subject graphically with the support of the literature. Thus, it tests the issues within the subject, limitations and discussion for future studies.

3. Store Facade Design and Showcase Concepts

Showcases basically aim to protect and show. Showcases are basically the unit of the space that protects the products from the environment while exhibiting them. The goal of displaying in this unit is to show the product, to identify the store to which the product belongs and to convey the value of the brand belonging to the store with a summary information (Mesher, 2013). The origins of showcases date back to the late 18th century. The production technologies developed with the industrial revolution have brought opportunities to all areas of life. The fact that glass material can be produced in large surfaces has brought vitrines to a defined state. During this period, as the retail sector grew, store owners developed the need to better display their products. In the process until today, showcases fulfill various functions in the retail sector;

Product Display,

Representing Brand Identity,

Showing Season-Collection Stories of Products,

Customer Attraction and Attracting Attention.

The outer shell of the architectural volume is the structural unit that limits the inner shell and creates comfort with environmental parameters. The facade also has an identity expressive function that defines who the building belongs to. This expression is blended with visual aesthetic concerns and functional infrastructure, adding value to the architecture (Jin & Overend, 2014).

Facade design offers customers an invitation to enter the store. A well-designed facade encourages customers to step into the store and starts their time inside in a more positive way. Furthermore, the facade design can reflect the store's brand identity and values. The brand's colours, logo and overall design aesthetic can be used in the facade design and this can help to create a bond between the brand and customers.

In short, from past to present, shop window and facade design is a critical element that greatly influences the customer experience. By having an inviting image, it attracts customers to the store and allows them to have a more positive experience inside. Functionally, it can benefit the structure and the individual's use of building-space.

4. FINDINGS and DISCUSSION

The eye is one of our five sense organs that provide visual perception. It can be said that it is one of the first and most important perceptions in our life experiences. In this respect, stores are important in the perception of the outer shell as an architectural volume. When we consider the viewing angle of the human eye from the literature; It is stated that it has an average of 135 degrees vertically and 180-200 degrees horizontally (Luz, 2021). Seeing an object varies according to distance. As in Figure 1, the visual angle of the object getting closer to our eyes increases. As the same object moves away from our eyes, the visual angle decreases. Visual perception can change according to the distances of objects (Visual Angle, 2022). In this respect, while the object is perceived with large viewing angles at close distances, larger objects can be easily perceived with small angles at distant distances.

Figure 1. Visual Distance of the Eye (URL1).

In this parallel, shop windows can offer a limited visibility with a wide angle at close range. Due to its large volume, the architectural facade can offer a more optional visual perception with small angles from long distances. It is emphasised that retailing approaches in competitive conditions have started to create atmospheres that emphasise the brand and differentiate it from the environment (Turley & Chebat, 2002). The recognition of the stores and the product-based trends and narrative concepts that change according to the seasons can be conveyed through common narratives reflected on the facade from the shop windows. This transfer is shown in Figure 2. In order to increase the attractiveness of the stores from long distances and to show the products and the stories of the products exhibited in the showcases from long distances, integrated design applications have recently been made on the facades.

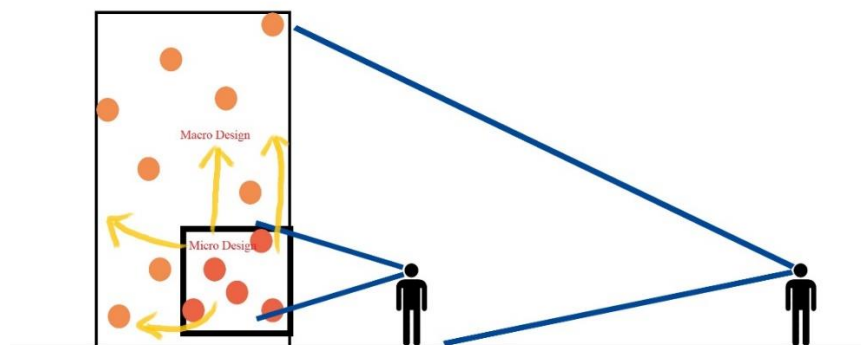

Figure 2. Showcase Facade Vision Perception (by the author)

III. International Architectural Sciences and Applications Symposium **September 14-15, 2023, Naples, Italy**

The architectural facade, which is large in size in line with the visual characteristics of our eye organ, can also be integrated with the design concept applied as a period of showcases. Showcases show the store and the products sold in an external environment such as a street, street or in an internal environment such as a shopping centre. The showcase displays the products in a limited space by protecting them with a glass surface. This boundary can be originated with the creativity of art, which is unique in the culture of consumption. The concepts applied in showcase designs are at the targets that attract attention in this flow and make the brand feel at high levels (Crewe, 2016). In current applications, these objectives are not limited to showcases but also extend to the facade. Depending on the characteristics of the architectural structure, the showcase concept can provide many advantages by reflecting to the outside and going to macro scales.

On the basis of the product, it is exhibited according to the viewing distance of individuals and the volume of the space. Closer monitoring is taking place here. The external environment can be perceived from long distances. At this stage, the facades that define the store come to the fore. Showcases are approached with the image given by the facade. The first impression can be realised with the image given by the facade from a long distance. The shop window is approached in a chain and the store can be entered. Here, a guiding effect can be realised with a holistic expression of the concept of showcases at a closer distance than the distant architectural facade.

In addition, designs that can be installed and dismantled on the facades, just like the shop windows, should be realised within the specified period. Based on the surface and structural limitations of the architectural facade, facade designs that can be installed and dismantled should be planned. The design language in the shop windows should be at the same equivalence on the facades. Because the facade seen from a long distance should be a deceptive display with the showcases to be watched closely. With the application of a whole design language on the facades and showcases, the products sold by the store can be shown correctly. Entering and shopping in the store to be formed together can benefit the consumption experience. Thus, the loyalty of the brand to individuals can increase. The shopping action that can be repeated for future times can be created with this flow.

5. CONCLUSION and RECOMMENDATIONS

The display concepts adapted according to the sales seasons in shop windows are also reflected in the facade design in terms of attractiveness. The facade can be designed in parallel with the display concept applied in the shop windows. As a result, the facades, which are the first to be monitored, can focus on the showcases by making a call to distant distances. An aesthetic presentation can be realised by watching the products in the showcases and the ongoing exhibition concept. Artistic applications transferred to facades and showcases can create memorable impressions. Recognition of brands, contribution to commercial action and satisfaction in consumption can be realised through common exhibitions on the facades extending from the micro scale of shop windows to the macro scale. This balance is established with the design discipline and can be revitalised with interdisciplinary multi flow in interior architecture-architectural areas.

In the study, concept integrity is considered in the common denominator and it aims to transfer a common design language from the shop window to the facade. Since the design is based on discipline planning, it is possible to be applied between micro-macro dimensions. For future

studies beyond these limits, it is foreseen to investigate digital integration, customer experience and sales performance measurement, modular system proposals, material and application proposals in showcase and facade partnership.

ABSTRACT

People are inseparably linked with nature and the actions and behaviors of humans directly and indirectly affect the quantity and quality of nature. Its quality and availability likewise affect humans. Inevitably, some environmental problems have been an important issue in the past several decades, especially for protected areas. Such problems have been considered scientific and economic problems, yet there has been another approach merged in addition to scientific and economic ones as societal dimensions. Societal dimensions refer to how and why society value natural resources, how people want resources managed, and how people affect or are affected by protected area management decisions. The societal dimensions inquiries strive to understand human traits and how to incorporate that understanding into management planning and actions. The concepts of values toward protected areas have been analyzed in depth in developed countries (e.g., the US), but this argument, unfortunately, has not been discussed enough in developing countries (e.g., Turkey). Therefore, investigation of the value concepts by literature review in sociology and social psychology would allow us to overcome the initial steps of fulfilling the gap of the study on cross cultural understanding. The aim of this study is to provide an understanding of the values toward of protected areas as well as guidance on how these values can be understood and integrated into planning and design processes. Besides, to investigate how cultural differences influence people's value priorities in understanding and predicting of attitudinal and behavioral decisions to protected areas.

Keywords: Values, Protected Areas, Societal Dimensions, Culture.

1. INTRODUCTION

Environmental problems have been an important issue in the past several decades. Global warming and climate change due to the greenhouse effect, deforestation and species extinction, exhaustion of fisheries, agricultural land, and pollution of air and water supplies are some of the main dangers to the Earth (Oskamp, 2000). Earlier, environmental problems have been

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

considered as scientific and economic problems, yet there has been another approach merged in addition to scientific and economic ones as societal dimensions. This approach has been drawing more public attention since the second half of the twentieth century.

The investigation of value concepts is one of the areas of social sciences. In this respect, the concepts of values toward protected environments have been analyzed in depth in developed countries (e.g. the US), but this argument, unfortunately, is not applicable to undeveloped and developing countries (e.g. Turkey). Therefore, investigation of the value concepts by literature review in sociology and social psychology would allow us to overcome the initial steps of fulfilling the gap of the study on cross cultural understanding.

In this paper, the focus is to investigate how cultural differences influence people's value priorities in understanding and predicting of attitudinal and behavioral decisions. The following literature are used to attempt to demonstrate and support this argument stated above.

2. MATERIAL and METHOD

Definitions of "Value"

The term value is quite complex, as it is a multi-dimensional concept that is often viewed synonymously with many other similar terms such as beliefs, attitudes, preferences, desires, likes, meanings, and benefits. The concept of values has been applied to various social sciences; however, there is no consensus on the definition of values. Deth & Scarbrough (1995) came up with more than 180 different definitions of values.

In the study of Rohan (2000), the word of "value" is used either as a verb or noun. As a verb, value refers some higher-level evaluation. When people use value as a verb, they are expressing a deeper meaning related to its entity. On the other hand, value, as a noun, was investigated as a dilemma in that people use value to evaluate their environment to understand their motivations under their responses to environments. Schwartz & Bilsky (1987, 1990), proposed five features of the values: (1) beliefs, (2) desirable end states or behaviors, (3) trans-situational guides, (4) selection and evaluation of behavior and events, and (5) the relative ordering of beliefs, desirable and states or behavior or guides.

Although the values are divided as value priorities and evaluations of specific entities, people use different expressions. Rohan (2000) states that people use the word of value for their evaluations of specific entities, and they also use to describe their evaluations of abstract trans-situational guides. However, the term of value is not appropriate for the trans-situational evaluation. For example, people may say "I value that table", and say "I value security." In detail, perhaps, people may assume, in this case, table is equally important to security by the usage of "value", which may generate ambiguity. Rohan (2000) brought the term "attitude" to distinguish these two different concepts of value, which is a genuine solution for this ambiguity. Overall, as a verb, value means the process of ascertaining the merit of an entity, whereas a noun version refers to the result of this process.

Henning (1998) defines values as "individual and collective concepts with emotional, judgmental, and symbolic components that we use to determine what is important, worthwhile and desirable. Thus, values contain, and at the same time evolve from, judgements and beliefs about what is 'good' or 'bad' and 'right' or 'wrong'."

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Vaske and his colleagues (2001) describe two types of beliefs, one is basic beliefs which “strengthen and give meaning to fundamental values” and the other is normative beliefs which are “judgements about what is appropriate in a specific situation.”

3. FINDINGS

Approaches to the Values Concept

Although multiple definitions have been offered in literature, there are three popular social psychologists offering research theories about values: Milton Rokeach, Shalom Schwartz, and Ronald Inglehart.

Rokeach (1973) defined values as the guiding principles in the life of an individual or a group. “Value is an enduring belief that a specific mode of conduct or end state of existence is personally or socially preferable to an opposite or converse mode of conduct or end state of existence” (Rokeach 1973, pg. 5). He proposed two sets of values: the terminal values and instrumental values. The terminal values refer to desirable end-states of existence, while the instrumental values refer to preferable modes of behavior. Eighteen value types are listed for each set. Terminal values are a world at peace, family security, freedom, equality, self-esteem, happiness, wisdom, national security, salvation, true friendship, a sense of accomplishment, inner harmony, mature love, a comfortable life, a world of beauty, pleasure, social recognition, and an exciting life. Instrumental values are ambitious, broadminded, capable, cheerful, clean, courageous, forgiving, helpful, honest, imaginative, independent, intellectual, logical, loving, obedient, polite, responsible and self-controlled.

Schwartz (1992) defined value as: “a desirable trans-situational goal varying in importance, which serves as a guiding principle in the life of a person or other social entity” (pg. 21). Accordingly, Schwartz (2006a) proposed ten different basic values stated below (pg. 1-2):

1. Self-Direction: Independent thought and action; choosing, creating, exploring.
2. Stimulation: Excitement, novelty, and challenge in life.
3. Hedonism: Pleasure and sensuous gratification for oneself.
4. Achievement: Personal success through demonstrating competence according to social standards.
5. Power: Social status and prestige, control or dominance over people and resources.
6. Security: Safety, harmony, and stability of society, of relationships, and self.
7. Conformity: Restraint of actions, inclinations, and impulses likely to upset or harm others and violate social expectations or norms.
8. Tradition: Respect, commitment, and acceptance of the customs and ideas that traditional culture or religion provides the self.
9. Benevolence: Preserving and enhancing the welfare of those with whom one is in frequent personal contact (the ‘in-group’).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

10. Universalism: Understanding, appreciation, tolerance, and protection for the welfare of all people and for nature.

Figure 1. A theoretical model of the relation among values (Schwartz, 2005).

Schwartz distinguishes these ten value types by investigating individual levels of value, which are organized with two dimensions: (a) from self-transcendence to self-enhancement and (b) from openness to conservation. Self-transcendence is embracing the welfare of others. Self-enhancement is emphasizing individual's interests. Openness refers to accepting change, risk and unpredictability. Conservation means preservation of the status quo.

On the other hand, Schwartz (2006) approaches to the cross-cultural values different than the individual ones by distinguishing six primary values, which are: autonomy, embeddedness, hierarchy, egalitarian commitment, self-mastery, and harmony. People are viewed as autonomous, bounded entities in autonomy cultures. They should cultivate and express their preferences, feelings, ideas, and abilities, and find meaning in their uniqueness. People are viewed as entities embedded in the collectivity in cultures with embeddedness. The life bases on largely through social relationships, through identifying with the group, participating in its shared way of life, and striving toward its shared goals. People recognize others as moral equals who share basic interests as human beings in egalitarianism. People are socialized to internalize a commitment to cooperate and to feel concern for everyone's welfare. There is an unequal distribution of power and roles that relies on hierarchical systems in hierarchic cultures. Harmony emphasizes fitting into the world as it is, trying to understand and appreciate rather than to change, direct, or to exploit. Important values in harmony cultures include world at peace, unity with nature, and protecting the environment. Finally, mastery encourages active self-assertion to master, direct, and change the natural and social environment to attain group or personal goals. Values such as ambition, success, daring, and competence are especially important in mastery cultures Schwartz (2006 pg.141). A country's position on each of the six dimensions represents the nature of individuals' shared ideals within a specific cultural context. Since cultural values are defined as representing common ideals, they are derived by averaging

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

the value priorities of individuals within a given society based on a multidimensional scaling analysis (Schwartz, 1994).

Inglehart (1977) came up with a post-materialist approach, individuals under the influence of material prosperity in modern industrial societies, tend to reject material values and to endorse new goals relating to quality of life. Although material values stem from needs for physiological sustenance and safety, post-material values stem from non-physiological needs, such as esteem, self-expression, and aesthetic satisfaction (Inglehart, 1990, p. 68). The post-materialist values are associated with a reshaping of social norms that emphasize new issues such as freedom, self-expression, and the quality of life. Inglehart (1977) developed an instrument for measuring value orientations. The instrument is consisted of a list of statements, which concern the evaluation of materialist and post-materialist political goals. He describes the tradition/secular-rational dimension, for example, as centrally concerned with orientations toward authority (Inglehart & Baker, 2000).

By considering the theories of value concepts proposed by Milton Rokeach, Shalom Schwartz, and Ronald Inglehart, culture is often defined as the integrated pattern of meanings, beliefs, norms, symbols, and values that individuals hold within a society, with values representing perhaps the most central cultural feature (Hofstede, 2001; Schwartz, 2004). These values “express shared conceptions of what is good and desirable in the culture, the cultural ideals” (Schwartz, 2004, p. 2). Parallel to individual-level values—which involve enduring goals that serve as guiding principles in people’s lives (Rokeach, 1973; Schwartz, 1992)—cultural value dimensions represent the society’s guiding principles. These principles contribute to the formulation of individuals’ attitudes, beliefs, and behaviors.

Rokeach (1977) notes that in human discourse it can be evidenced that “value” implies either,

- 1) a person holds a “value”, or 2) an object has “value” to a person.

On the one hand, **subjective “values”**, are conceived as standards, which are reflective of value formation and the determinants of valuing (in the verb sense). Williams and Watson (2000) define these values as something we value (ideals). They are influenced by the social, cultural, economic, educational, and many other broad national trends that one is exposed to in their lifetime. They encompass beliefs, perceptions, preferences, and value orientations and give rise to one’s environmental disposition, attitudes, and ethics. They also can be conceived as the precursors to natural resource legislation and policy, which leads to nature protection.

On the other hand, there are **objective “values”**, conceived in the noun sense as components of nature protection, which include such notions as inherent worth, intrinsic value, and instrumental, functional, and derived values. These values encompass human and ecological meanings and services and give rise to behavior. Williams and Watson (2000) define these values as something that is of value (benefit); they are viewed as some value to be gained or received from the environment rather than impressed upon it, and they precede valuation.

Rokeach’s methodology has since then been popularly used in natural resource research to measure values quantitatively. Researchers often employ Rokeach’s method by using a finite, quantitative rating system of environmental values in which respondents are encouraged to make explicit their hierarchy of values. (Brown & Reed 2000, Cordell & Stokes 2000, Cordell et al. 1998, and Haas et al. 1986). In these cases, the researchers pre-determined a list of environmental values in which, rather than ranking about the importance of the values in their

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

life, respondents were asked to rate the values about their importance to wilderness, national parks, national forests, protected areas, etc. Survey responses were then offered to guide management actions and policy decisions.

One qualitative method that would be effective in measuring protected area values is the "Hermeneutic Approach." The hermeneutic paradigm focuses on the meaning of the experience, with the belief that "experience is best understood as a whole rather than as the sum of its parts". Following this method, open-ended interviews are employed, to receive narrative descriptions of protected area visitors. Open-ended interviews where the interviewer facilitated discussion about certain themes, without leading respondents to reveal meanings. The interviewer also asked for clarifications in responses as needed. They found that when responses were like telling a story, they were more successful in revealing meanings than if they were viewed as responses to interview questions.

Therefore, they encouraged "people to tell the story of the experience rather than list the aspects of the experience". From this, they sought to "identify predominant themes through which narrative accounts of specific experiential situations (could) be meaningfully organized, interpreted and presented". Not only were the researchers able to identify the quantitative, objective elements of experience that are important to visitors, but they were also able to realize the meaning behind the importance of those elements, therefore moving beyond a finite, quantitative rating system of environmental values.

Medina and Rodriguez (1998) used a "Participatory Rural Appraisal" methodology to assess perceptions of tourism impacts in Venezuela's Canaima National Park. This method was effective in identifying the social, cultural, and subsistence values that are attributed to environmental elements there. It was also useful for realizing present environmental changes that are influencing these values, as well as the source to which the change could be attributed.

Participatory Rural Appraisal is a method in which the learning of environmental values is "from, with, and by" a specific group of citizens under study. This method enables people "to share, enhance, and analyze their knowledge of life and conditions, to plan, to act, monitor and evaluate." Therefore, "information in Participatory Rural Appraisal is internally produced, analyzed, owned and shared by local people instead of just gathered and analyzed with the biases of outsiders" (Medina and Rodriguez 1998). This method, like the hermeneutic approach, seems appropriate for measuring values qualitatively. By focusing on the knowledge and experience of respondents themselves, researchers would be able to gain depth of understanding and, subsequently, identify a range of values truly held by respondents within a specific context.

4. CONCLUSION

According to literature that is covered above, we can summarize the main features of the conception of basic values:

- Values are beliefs, but they are beliefs tied inextricably to emotion, not objective, cold ideas.
- Values are motivational constructs that refer to the desirable goals people strive to attain.
- Values transcend specific actions and situations. They are abstract goals. The abstract nature of values distinguishes them from concepts like norms and attitudes, which usually refer to specific actions, objects, or situations.

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

- Values guide the selection or evaluation of actions, policies, people, and events. That is, values serve as standards or criteria.
- Values are ordered by importance relative to one another. People's values form an ordered system of value priorities that characterize them as individuals. This hierarchical feature of values also distinguishes them from norms and attitudes (Schwartz, 2006a, pg. cover page).

In summary, the cultural approach to the concept of values focuses on phenomena arising from interrelations between an active individual and his/her culture. Values belong to the class of hierarchically organized symbolic tools that are used to regulate the social and psychological functioning of individuals and groups. The cross-cultural approach is useful for researching the development and functioning of a value system in concrete transactions between individuals and their environment. Values reflect both an individual's needs and social regulation. A value system provides a shared representational framework, in which different individual and group positions are possible.

It is important to understand values so that natural resource legislation and policy, nature protection, management and valuation decisions can be properly guided. A crucial component of this is reviewing the literature on the study of values so that familiarity can be gained with the broad array of terminology surrounding "values." It is also important to be familiar with the many different methods that can and have been employed in studying and measuring values. By refining and expanding upon past studies, as well as forging new ones, we can further expand our knowledge of the science of values.

ABSTRACT

With the rapidly increasing population in today's world, urbanization rates are also on the rise, subjecting our cities to more intense construction with each passing day. This situation adversely impacts cities in various ways, leading to the reduction of natural spaces, the degradation of green areas, and a decline in biological diversity. Additionally, dense urbanization, accompanied by the expansion of industrial areas and factors such as greenhouse gases, has precipitated a global increase in temperatures. In this study, Esenyurt, one of the districts of the Istanbul metropolis that has received significant immigration and experienced intense urbanization in recent years, has been the focal point. The research aimed to highlight the effects of the 28-year transformation in the Esenyurt district from 1990-2018 on Land Surface Temperature (LST) and vegetation. This was achieved by investigating the LST and Normalized Difference Vegetation Index (NDVI) values and their interrelations. These investigations were conducted by analyzing Landsat 5 TM and Landsat 8 OLI_TIRS satellite images from 1990 and 2018 using Geographical Information Systems (GIS) and Remote Sensing (RS) techniques. In this study, LST maps were generated utilizing satellite images from the relevant years. The relationships between these LST values and the NDVI values of the corresponding years were examined through correlation analysis. In conclusion, the impacts of Land Use/Land Cover (LULC) on the urban heat island, in conjunction with NDVI and LST, were evaluated using the Esenyurt district as a case study. Within this framework, measures that can be adopted to mitigate the urban heat island effect during urban growth have been presented.

Keywords: Urbanization, LST, NDVI, Esenyurt, İstanbul.

1. INTRODUCTION

Today's rapid urbanization has brought about many undesirable problems in cities, such as a decrease in biodiversity, poor air and water quality, floods, drought, high energy consumption and urban heat island effect (Feyisa et al., 2014; Topal, 2022). It is reported that the main reason

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

for these emerging environmental problems and global climate change is due to increasing human activities (Demirbaş & Aydin, 2020). On the other hand, as the urbanization process increases in density and area on a global scale, land use and land cover changes also increase (Imhoff et al., 2010). Improper and uncontrolled implementation of these changes in urban areas has increased the effect of the urban heat island. The urban heat island effect is the accumulation of heat within an urban area. This situation occurs with the construction of urban areas (Yang et al., 2006; Qin, 2015). An urban heat island can be defined as a situation where urban areas have higher temperatures than surrounding rural areas (Deilami et al., 2018). When surfaces covered with vegetation and wetlands transform into areas dominated by impermeable surfaces, agricultural lands, or bare lands, it increases surface temperature and intensifies the urban heat island effect (Ahmed et al., 2013; Pal & Ziaul, 2017).

Land Surface Temperature (LST) value is used to measure temperature variations in cities and to understand changes in land cover (Imhoff et al., 2010). Today, Geographic Information Systems (GIS) and Remote Sensing technology (RS) are among the tools used for monitoring land use/land cover (LULC) changes and extracting the land surface temperature (LST) (Tomlinson et al., 2011; Kafy et al., 2020). Through RS studies, high-resolution LST maps of the desired area can be generated, allowing for quick detection of temporal changes (Mercan, 2020). On the other hand, NDVI (Normalized Difference Vegetation Index) is frequently used in vegetation transformations, land cover classification, and change analysis (Xu et al., 2016). The relationships between LST and NDVI have been explored in numerous studies (Gallo et al., 1993; Tan et al., 2020).

The formation of the urban heat island effect influences energy flow in urban ecological systems, hydrology, soil, climate, local environment, thermal comfort, and the health of the people in the region. However, it reduces air quality and increases ozone production (Stone & Rodgers, 2001; Yang et al., 2006; Zhou et al., 2011; Debbage & Shepherd, 2015). In this context, understanding heat island effects is very important in terms of improving the quality of life. Understanding how the model and structure of urban expansion influence the effects of urban heat islands is a significant topic for planning disciplines in terms of urban environmental planning and natural resource management (Imhoff et al., 2010; Tonyaloğlu, 2019). Since the intensity and scope of urbanization in developing countries are very high, researching the effects of urban heat islands in cities in these countries is becoming increasingly important (Pal & Ziaul, 2017). In this context, this study focuses on the Esenyurt district, which is the most populous district in our country, one of the developing countries.

In this study, the aim was to reveal how the 28-year change between 1990-2018 in the Esenyurt district affected the region in terms of land use, LST (Land Surface Temperature), and vegetation. In this context, the land use situation was determined, and the relationships between the Land Surface Temperature (LST) and the Normalized Difference Vegetation Index (NDVI) were investigated. These inquiries were conducted by analyzing the Landsat 5 TM and Landsat 8 OLI_TIRS satellite images for the years 1990 and 2018 respectively, using Geographic Information Systems (GIS) and Remote Sensing (RS) techniques. In the study, LST maps were produced using thermal bands of images from the relevant years. The relationships between LST and NDVI values for the relevant years were questioned by correlation analysis. As a result, the effects of LULC change and NDVI value on LST and the urban heat island were evaluated. In this context, measures that can be taken to reduce the urban heat island effect during urban growth have been presented.

2. MATERIALS and METHODS

2.1. Materials

The main focus of the study is the Esenyurt district of Istanbul. Esenyurt is located on the European side of Istanbul. Esenyurt district is surrounded by Avcılar in the east, Büyükçekmece in the west, Başakşehir in the north and Beylikdüzü in the south (Figure 1). The district covers an area of 43.16 km². The D100 highway, which extends in a northwest-southwest direction, plays a significant role in determining the district's transportation and administrative boundaries. Additionally, in the west, there's the TEM-Hadımköy connecting road, and in the northern section, the O-3 Highway that connects the region to Thrace and Anatolia also contributes significantly. In the district, the slope generally varies between 5-20%, however, towards the east of the Hoşdere Esenyurt road and the Akçaburgaz, Atatürk, and İstiklal neighborhoods, the slope ranges between 20-31% and the land in these areas is elevated (Esenyurt Municipality, 2019).

Esenyurt district has a western Marmara continental climate in terms of weather conditions. Considering the general climate characteristics of Istanbul, summers are dry and winters are rainy. According to the long-term data (1950-2022) of the Meteorological General Directorate, the average annual temperature is 15.2°C. The average annual precipitation is 660.9 mm. The dominant wind direction is north and northwest. The 3rd degree strong wind is the south, southwest wind (Esenyurt Municipality, 2015; Turkish State Meteorological Service, 2023).

As of 2022, the population of Istanbul was 15,907,951. In the same year, the population of the Esenyurt district was 983,571. This population constitutes 6,18% of the province's population. With this population data, Esenyurt district is the most populous district in Türkiye. The population of the district is higher than in many provinces (TÜİK, 2023).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

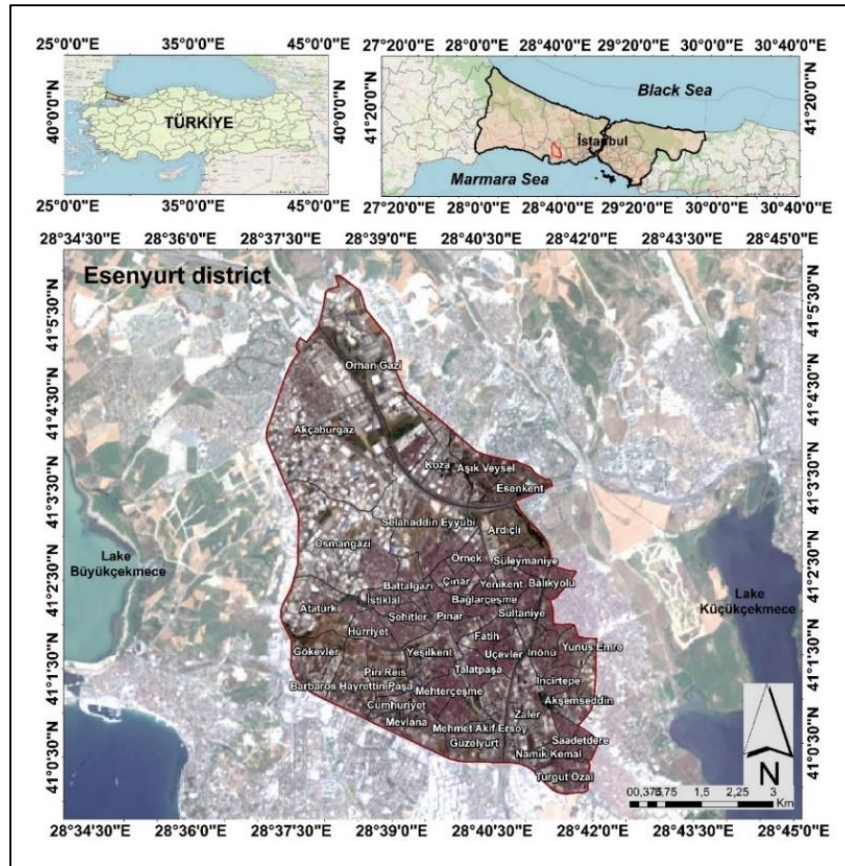

Figure 1. Location of the study area

The district boundaries of Esenyurt used in the study were sourced from www.openstreetmap.org (OpenStreetMap, 2023). In the study, Landsat 5 TM from 1990 and Landsat 8 OLI_TIRS image from 2018 were used to observe land use through NDVI and LST values. Care was taken to select images with a cloud cover of less than 10%. These images were downloaded for free from the US Geological Survey's website at <https://earthexplorer.usgs.gov/> (USGS, 2023). Calculations and map-making were carried out with the downloaded images using the ArcMap 10.8 program. Landsat images are among the most commonly used satellite images for LST calculations. The features of the used images are presented in Table 1.

Table 1. Features of the Landsat satellite image used in the study

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

2.2. Methods

The methodology of this study consists of three stages. These are: calculating the NDVI value, calculating the LST value, and determining land uses.

2.2.1. Calculation of Normalized Difference Vegetation Index (NDVI) values

This index is one of the commonly used indices for mapping vegetation (Zha et al., 2010). It was developed by Rouse et al. (1973). The calculated value ranges from -1 to +1. Values ranging from -1 to 0 indicate no vegetation, while values closer to +1 represent the highest green vegetation density (Ekumah et al., 2020). Values below 0 indicate water, snow, and clouds; values between 0 and 0.2 represent bare land/built-up areas/rocks; values between 0.2 and 0.5 signify a mixture of soil and vegetation; and values above 0.5 denote areas covered with vegetation (Avdan & Jovanovska, 2016). The NDVI formula is given in the following equation (Rouse et al., 1973):

$$NDVI = (NIR - Red) / (NIR + Red) \dots \dots \dots eq (1).$$

2.2.2. Calculation of Land Surface Temperature (LST) values

First of all, spectral radiance value conversion is applied to the thermal image band values (DN: Digital Number) to be used. In this equation: $L\lambda$: temperature of atmosphere spectral radiance, ML : band-specific multiplicative rescaling factor from the metadata, Q_{cal} : quantized and calibrated standard product pixel values (DN) and AL : band-specific additive rescaling factor from the metadata (Akyürek, 2020; Kumari et al. al., 2018).

$$L\lambda = ML * Q_{cal} + AL \dots \dots \dots eq (2).$$

After this conversion, the TIRS band data is converted from spectral radiance to brightness temperature (BT) using thermal constants. Results in Celsius are obtained by revising the radiation temperature by adding absolute zero (Avdan & Jovanovska, 2016). BT represents the brightness temperature in degrees Celsius. $L\lambda$ denotes spectral radiance. $K1$ is a band-specific thermal conversion coefficient (given as 774.8853). $K2$ is another band-specific thermal conversion coefficient (given as 1321.0789) (Güneş et al., 2021).

$$BT = \frac{K2}{\ln\left(\frac{K1}{L\lambda} + 1\right)} - 273.15 \dots \dots \dots eq (3).$$

After this step, the Normalized Difference Vegetation Index (NDVI) must be calculated in order to determine the Earth's surface emissivity and vegetation ratio. In determining the LST, NDVI values should be obtained from reflectance values, not DN values (Akyürek, 2020). (eq (1)). After calculating the NDVI value, the proportion of the vegetation (P_v) is calculated using Equation 4. Then, the land surface emissivity LSE (ϵ) value suggested by Sobrino et al.(2004) is calculated using equation 5 (Kumari et al., 2018).

$$P_v = ((NDVI - NDVI_{MIN}) / (NDVI_{MAX} - NDVI_{MIN}))^2 \dots \dots \dots eq (4).$$

$$\epsilon = 0.004P_v + 0.986 \dots \dots \dots eq (5).$$

After calculating the LSE (ϵ) value, the last step is to calculate the LST value.

$$LST = \frac{BT}{1 + \left[\frac{\lambda BT}{p}\right] \ln \epsilon \lambda} \dots \dots \dots eq (6).$$

TeMALab

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Wavelength $\lambda=10.895$ is used while calculating LST as Celsius ($^{\circ}\text{C}$), and BT is at-sensor BT ($^{\circ}\text{C}$) (Avdan & Jovanovska, 2016). The ρ value here is a fixed value and is calculated with the help of the formula given in equation 7:

$$\rho = h * c/s = 1.438 \times 10^{-2} \text{ mK} \dots \dots \dots \text{eq (7)}.$$

(h: Planck constant (6.626×10^{-34} Js), s: Boltzmann constant (1.38×10^{-23} J/K), c: Speed of light (2.998×10^8 m/s) (Akyürek, 2020).

2.2.3. Determination of Land Uses

In the study, the Urban Atlas data for the year 2018 was used to evaluate the relationship between LST values and land use status. The Urban Atlas data of the European Environment Agency (EEA) is produced from CORINE data, which is arranged semi-automatically and manually and is presented in the Copernicus Land Monitoring Service data portal. While CORINE data covers the entire country, urban atlas data only covers urban areas and therefore has a higher resolution. It has a resolution 100 times higher than CORINE data, making the urban atlas data more accurate for studies where land changes are observed (Aksoy et al., 2022).

3. FINDINGS and DISCUSSION

3.1. The Situation of Esenyurt District in the Historical Process

When the period after 1970 is examined, one of the most important turning points for Esenyurt occurred with the Grand Istanbul Master Plan approved in 1972. Accordingly, the positioning of Esenyurt next to the new highway and showing it as a settlement area for 100,000 thousand people has made the district a center of attraction in the field of housing and industry. After these dates, the process of land acquisition started with the increase in population. Later, with the population increase in Esenyurt, it was decided to establish a municipality of 6 neighborhoods with the same name in Esenyurt Village, with the decision numbered 87/34092 dated 21 December 1987. Esenyurt, whose growth accelerated in the early 2000s, became the new district of Istanbul by incorporating Kıraç on March 6, 2008 (Esenyurt Municipality, 2019).

After gaining the status of a district, Esenyurt, which initially had 20 neighborhoods, increased its number of neighborhoods to 43 based on a decision taken by the Esenyurt Municipal Council on December 5, 2014 (Ayhan, 2019). The district's population, which stood at 70,280 in 1990, grew to 891,120 by 2018 (TUİK, 2023). Based on the 2018 population data, the Pınar neighborhood is the most densely populated area of the district. Furthermore, the neighborhoods of Mehterçeşme, Yeşilkent, Süleymaniye, Os mangazi, Bağlarçeşme, Çınar, Balık yolu, and Talatpaşa each account for more than 3% of the district's total population. Therefore, these neighborhoods are also considered major residential areas in terms of population scale (Esenyurt Municipality, 2019). Satellite images of Esenyurt for the respective years, along with the spread of its residential areas, are provided in Figure 2.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

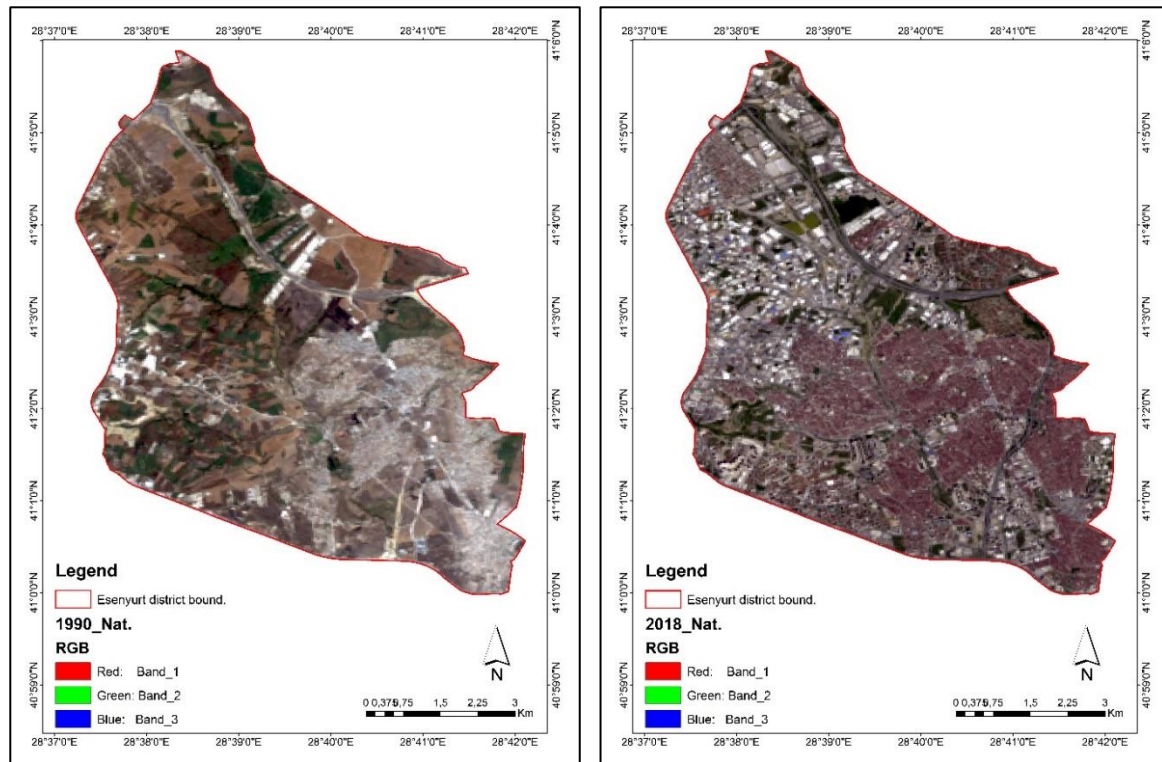

Figure 2. Landsat satellite images of Esenyurt district for the years 1990 and 2018 (Landsat 5, B3, B2, B1 natural band combinations and Landsat 8 B4, B3, B2 natural band combinations, respectively)

3.2. Findings on NDVI Analysis

Descriptive statistics of NDVI calculated with Landsat 5 and Landsat 8 images from 1990 and 2018 provided within the scope of the study are shown in Table 2.

Table 2. NDVI statistical results of Esenyurt district for the years 1990 and 2018

	Min	Max	Mean	Standard dev.
NDVI 1990	-0,12605	0,65672	0,13271	0,12037
NDVI 2018	-0,12428	0,58067	0,12626	0,11432

Accordingly, for 1990, NDVI min. was calculated as -0,13 and NDVI max was calculated as 0,66. For 2018, NDVI min was calculated as -0,12 and NDVI max was calculated as 0,58. According to the NDVI results, the average value was 0,13 for both years. When the results were evaluated, it was seen that the vegetation areas, which represent the highest density as they approached +1, decreased from 1990 to 2018. When Figure 3 is examined, it is understood that vegetation areas were low density in many neighborhoods of the district in 2018.

When the map given in Figure 4 is examined, it is seen that the NDVI value shows the lowest values in the central neighborhoods, which are densely populated in the settlements in the

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

district center. However, the NDVI value is also low in some parts of the northern part, where large industrial areas are located.

In addition, according to the NDVI results, for the year 1990, 3.158,35 ha of the study area were calculated as bare land/built-up areas/rocks, while vegetation areas were calculated as 66,64 ha (Figure 4). For the year 2018, bare land/built-up areas/rocks were calculated as 3.410,95 ha, while areas with vegetation were calculated as 33,33 ha.

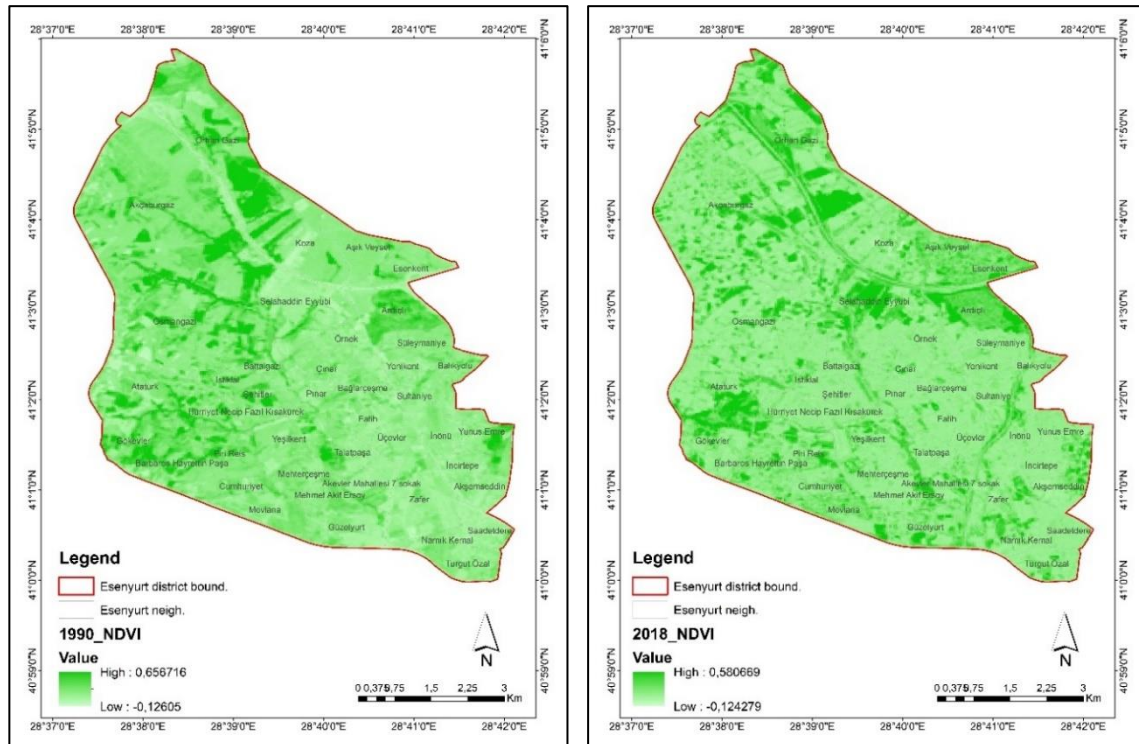

Figure 3. NDVI Maps of Esenyurt District for the years 1990 and 2018

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

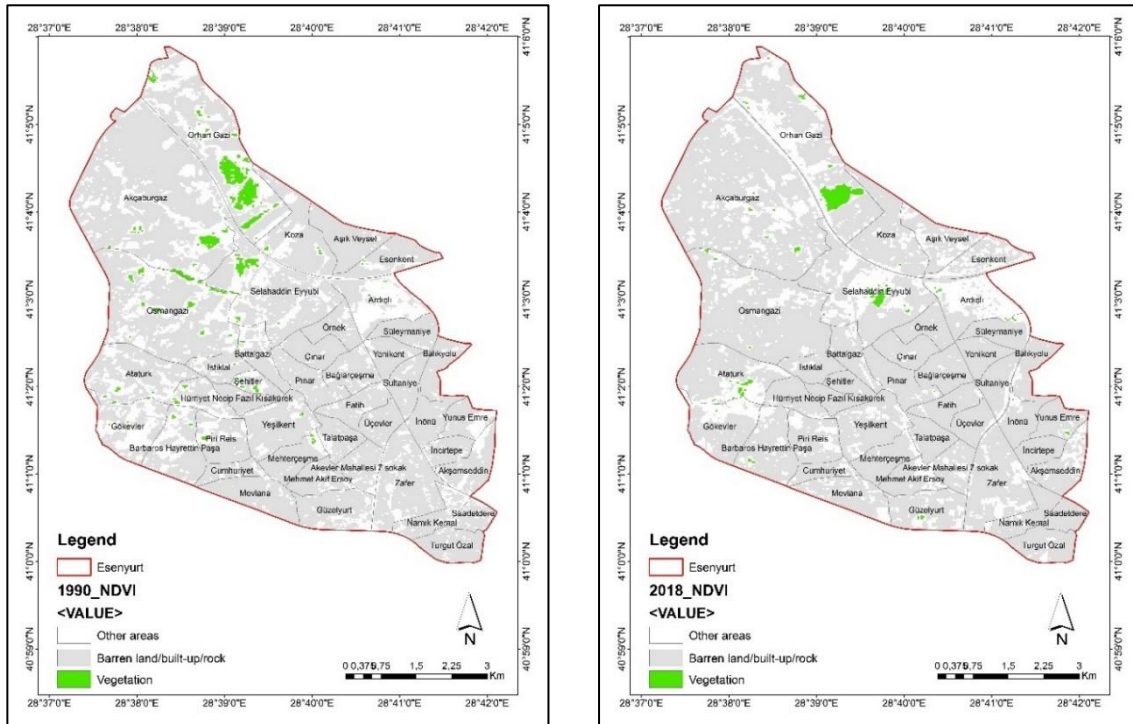

Figure 4. NDVI class maps of Esenyurt district for the years 1990 and 2018

3.3. Findings on LST analysis

Using Landsat 5 and Landsat 8 satellite images, land surface temperature maps of the study area for the years 1990 and 2018 were produced by applying the process steps explained in land surface temperature calculations (Figure 5). Land surface temperature values varied between 16.1°C and 38.0°C for 1990. Land surface temperature varies between 21.6°C and 41.7°C in 2018. According to these results, the maximum temperature difference in the area between 1990 and 2018 is 3.7°C and the minimum temperature difference is 5.5°C.

When examining land surface temperature values, especially those above 30°C, it is observed that for the year 1990, these values were distributed in the newly developed areas and vacant lands in the northeast and southern parts of the district. For 2018, especially in the southern parts of the district where there is a significant amount of construction, neighborhoods such as İstiklal, Hürriyet, Necip Fazıl Kısakürek, Şehitler, Battalgazi, Pınar, Çınar, Örnek, Bağlarçeşme, Fatih, Üçevler, Talatpaşa, Mehterçeşme, Mehmet Akif Ersoy, Süleymaniye, Yenikent, Sultaniye, Balık Yolu, İnönü, Yunus Emre, İncirtepe, and Saadetdere were observed to have higher temperatures than their surroundings. These findings are significant in showcasing the urban heat island effect in these neighborhoods. On the other hand, in the district where the large-scale green space is quite limited, the lowest land surface temperatures have been calculated for green areas. These areas include the Gülbahçe cemetery in the northeast of the district, the Esenyurt picnic area, and other open green spaces. In these regions, temperatures have been observed to drop as low as 21°C.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

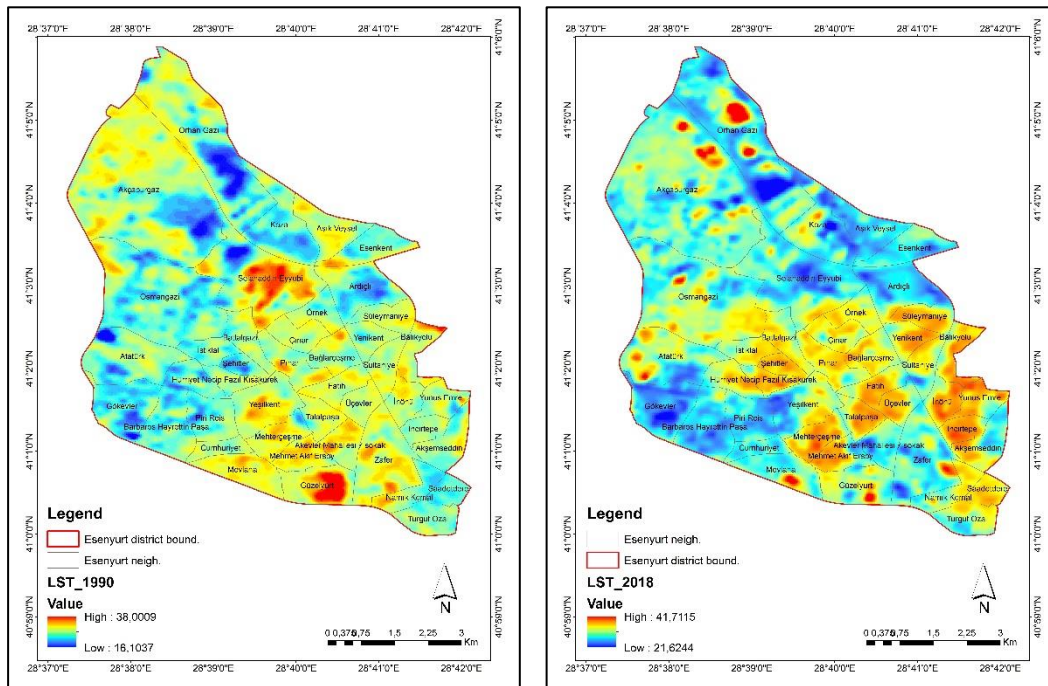

Figure 5. LST maps of Esenyurt district for the years 1990 and 2018

3.4. Investigating the relationships between NDVI and LST

To explain the relationship between land surface temperature (LST) and the Normalized Difference Vegetation Index (NDVI), which is used to understand land use changes, a correlation analysis was performed. For the evaluation of the results from the years 1990 and 2018, a correlation analysis was carried out using 488 randomly selected points. These relationships can be seen in Figure 6. The results indicate that in areas where land surface temperatures are lower, NDVI values are higher. The correlation analysis results show that the LST has a negative correlation relationship with NDVI. The correlation coefficient between LST and NDVI was calculated as $r=-0.477975581$ for 1990 and $r=-0.52422$ for 2018. The negative correlation finding related to NDVI in this study is consistent with the findings of previous studies (Karakuş, 2019; Alademomi et al., 2022; Moisa et al., 2022).

Figure 6. Correlation results for NDVI and LST values of Esenyurt district for the years 1990 and 2018

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

3.5. Investigating the relationships between land uses and LST

In the 1980s, Esenyurt had open lands where dry farming was practiced. However, today, these areas have largely been urbanized and transformed into plots. The district, which lacks a distinctive vegetative cover, has greenery mainly in areas that have been landscaped along roadsides and designated as parks (Esenyurt Municipality, 2015).

Land uses of Esenyurt district in 2018 were evaluated through Urban Atlas data (Table 3, Figure 7). Accordingly, it was seen that the continuous urban fabric coded 11100 covers 797,70 ha and these areas constitute 18,51% of the total area. It was observed that the discontinuous urban fabric covers 600,52 ha and these areas constitute 13,94% of the total area. Accordingly, continuous and discontinuous urban fabric covers a total area of 32,45% in the district. On the other hand, it was observed that the industrial areas with the code 12100, which include industrial, commercial, public, military and private units, which constitute a large part of the district, cover 1.420,97 ha and these areas constitute 32,98% of the total area. Due to the location of the district, the highways passing through it and forming borders and other related uses cover 606,23 ha in the district, and these areas cover 14,07% of the total area. Green urban areas in the district cover 152,65 ha and these areas constitute 3,54% of the total area. The arable lands and pastures in the district cover 292,46 ha and these areas constitute 6,79% of the total area. The areas representing herbaceous vegetation associations coded 3200 cover an area of 66,85 ha and these areas constitute 1,55% of the total area. These results are important as they show that 91,66% of the district, with 3.949,11 hectares, is covered with artificial areas and that natural areas are quite inadequate in the district.

Table 3. Land use distribution according to 2018 Urban Atlas data for the Esenyurt district

Main Class	UA_codes	UA_class	Area (ha)
Artificial Areas	11100	Continuous urban fabric	797,70
	11210	Discontinuous dense urban fabric	470,37
	11220	Discontinuous medium density urban fabric	68,72
	11230	Discontinuous low density urban fabric	28,26
	11240	Discontinuous very low density urban fabric	33,17
	12100	Industrial, commercial, public, military and private units	1.420,97
	12210	Fast transit roads and associated land	43,66
	12220	Other roads and associated land	562,57
	13100	Mineral extraction and dump sites	18,06
	13300	Construction sites	152,22
	13400	Land without current use	172,72
	14100	Green urban areas	152,65

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

	14200	Sports and leisure facilities	28,04
Agricultural Areas	21000	Arable land (annual crops)	101,54
	23000	Pastures	190,91
Natural Areas	32000	Herbaceous vegetation associations	66,85

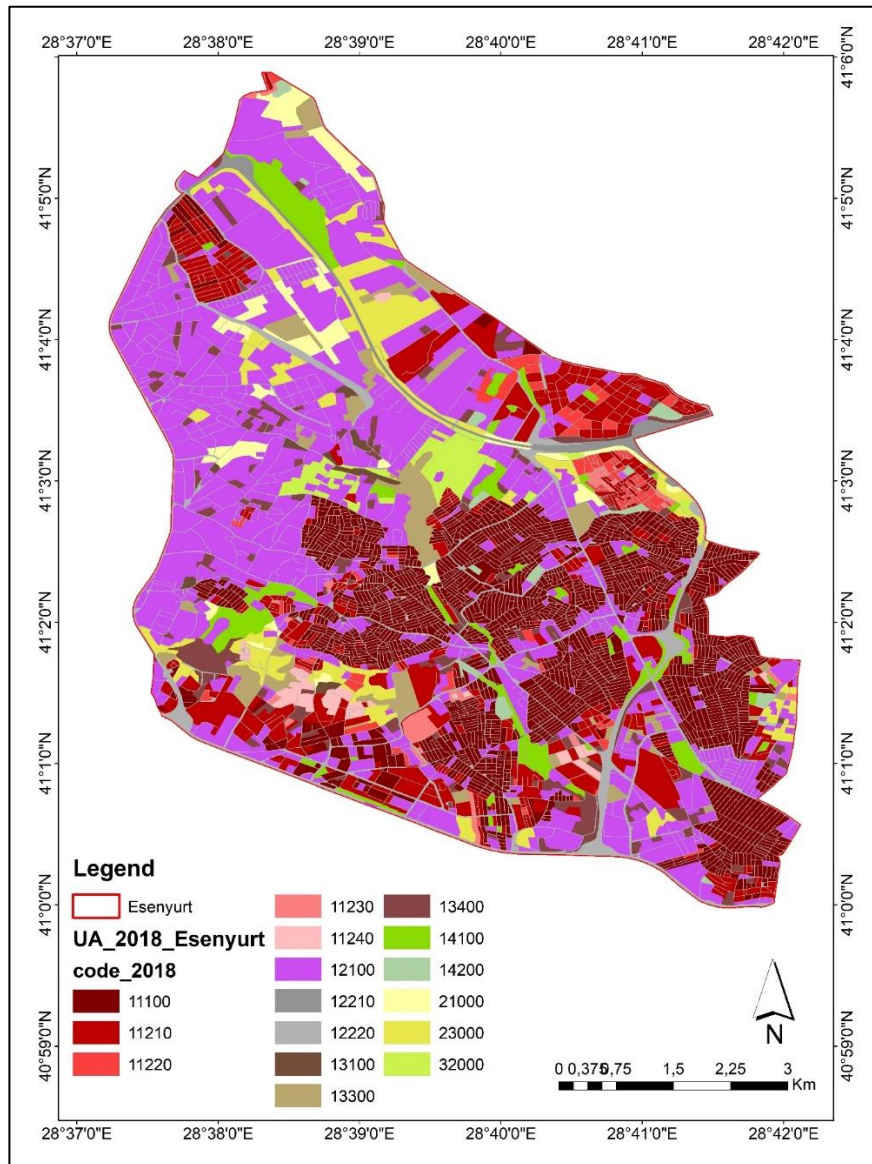

Figure 7. Land Use Map According to 2018 Urban Atlas Data For Esenyurt District

According to the 2018 Urban Atlas data for Esenyurt district, cross-sections were taken and evaluated in order to understand the relationships between land uses and LST. Looking at Figure 8, it can be seen that the land surface temperature decreases in areas located on green areas, and reaches the highest value in areas where residential areas are located. In addition, the LST value is high in bare lands. These findings were parallel to the findings of some researchers (Zhou et al., 2011; Sun et al., 2012). As a matter of fact, it has been shown that the LST value

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

increases in built areas and bare lands where urbanization is concentrated and these regions have higher land temperatures.

Figure 8. Sections showing land uses and LST relationships according to 2018 Urban Atlas data for Esenyurt district

4. CONCLUSION and RECOMMENDATIONS

In this study, which deals with the Esenyurt district of Istanbul, it is revealed how the land use change in the district in the 28-year period between 1990 and 2018 affected the region in terms

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

of LST and vegetation. Accordingly, the LST value differed in cultivated lands, bare lands, areas covered with vegetation and built-up areas. In this context, studies emphasize that urban heat island effects can be reduced by implementing appropriate land use planning (Kleerekoper, et al., 2012; Sun et al., 2012). Kleerekoper, et al. (2012) summarized that the way to do this in cities is through arrangements to be made in vegetation, water, built environment and material use. In this context, increasing vegetation cover is one of the most effective ways to reduce the LST value (Ferguson & Woodbury, 2007; Moisa et al., 2022).

In the study, the urban heat island effect was also investigated using the LST value. In this context, classes expressing land uses were determined using the 2018 Urban Atlas maps. It has been observed that the areas with the highest distribution are industrial areas. When the relationships between the calculated LST values and land cover were examined, it was seen that LST reached the highest value on artificial surfaces. These areas are the district center where continuous and discontinuous urban fabric areas are located. It was observed that the LST value reached its lowest value in natural areas covered with vegetation with herbaceous vegetation. It was determined that there was a moderate negative correlation between the NDVI (Normalized Difference Vegetation Index) value calculated in the study and LST.

When the findings regarding LULC, NDVI and LST in this study were evaluated together, it was concluded that the surface temperature increased in urban areas and decreased in areas with vegetation. These results also show heat island effects in urban areas. These urban heat island effects are especially in the neighborhoods with high population density of the district: İstiklal, Hürriyet, Necip Fazıl Kısakürek, Şehitler, Battalgazi, Pınar, Çınar, Örnek, Bağlarçeşme, Fatih, Üçevler, Talatpaşa, Mehterçeşme, Mehmet Akif Ersoy, Süleymaniye, Yenikent, Sultaniye. It was seen to be effective in Balık Yolu, İnönü, Yunus Emre, İncirtepe, Saadetdere (Figure 8).

With the increasing population, urban areas are expanding and growing every day. As cities grow and develop, it is understood how crucial the presence of green areas in newly planned areas is to minimize the urban heat island effect. Particularly in the example of Esenyurt, it is clear that the formation of areas that are limited in green spaces compared to the population, and have surrendered to the dominance of construction, negatively affects both the city and its inhabitants in many ways. This situation primarily causes adverse conditions ecologically, impacts the urban comfort of individuals, poses health threats, and affects the welfare level in various aspects such as cultural, social, and economic. This, in turn, disrupts the structure of the city by creating other pushing forces, such as incitement to crime and vandalism. Therefore, when establishing cities, it is essential to be aware that multifaceted and multi-layered parameters exist at every step towards the growth and development of cities. A sustainable and systematic city structure should be established in interdisciplinary consensus, involving landscape architects, urban and regional planners, architects, ecologists, environmental engineers, sociologists, and more.

On the other hand, enhancing the diversity and density of green spaces in cities, supporting built-up areas with rooftop gardens and vertical garden applications, reducing impermeable surfaces, and emphasizing the use of ecological materials are among the measures that can be taken. Additionally, high temperatures have negative effects such as reducing thermal comfort, bringing forth health risks, and decreasing the quality of life. Implementing such measures in cities is essential to minimize these effects. Furthermore, this issue is vital for creating sustainable and ecological living spaces, thereby ensuring sustainable development.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

In conclusion, this study analytically presents the environmental consequences of urbanization, especially in areas where urbanization is progressing rapidly, using the district of Esenyurt as an example. It is believed that these findings will provide valuable data for state units associated with urban planning, local governments, and other stakeholders in terms of urban planning and management for new planning initiatives.

ABSTRACT

Today, the urban-rural balance is developing and differentiating dramatically at the expense of natural areas-rural areas. With the increasing population and global economic mobility, a large part of the planet is shaped by human hands, and the emphasis expressed by scientists and experts is that cities will move away from being livable environments due to global climate change. As a solution, it is mentioned that the necessity of re-establishing the relationship of cities with nature is vital. Cities are ecosystems that contain natural structures and systems, and that involve the interaction of cultural and natural structures, in addition to being areas where anthropogenic activities are concentrated. Therefore, cities must maintain their ecosystem functions in a balanced and healthy way with planning practices that address cities with the perception of ecosystems. The Urban Paradigm Shift brings to the fore a "Nature-Oriented" urban scenario and emphasizes that cities, which are places of differences, protect ecosystems, water, natural habitats, and biodiversity; it is foreseen that there will be settlements that support sustainable consumption and production forms. In this paper, examples that will contribute to the improvement of the quality of life in a range based on nature-based solutions in urban design processes and that can be considered from energy-efficient structures to water-permeable surface coating materials will be included. To ensure the sustainability of cities, examples will be included where the functioning of different ecosystems (streams, agriculture, built environment, etc.) from natural to man-made ones find application in the city and its immediate surroundings and are reflected in design decisions. The fact that urban design projects prepared under the guidance of green infrastructure systems and nature-based solutions make a significant contribution to the solution of problems in detail and practice and that design concepts such as water-sensitive urban design (WSUD) and landscape urbanization (LU) are developing in this direction, will be evaluated in the determination between the different components in the urban spatial organization. In addition to the necessity of interdisciplinary work and cooperation between solutions in the specified design approaches, the subject will also be examined with examples in bio-engineering studies where relevant engineering fields are also involved in the design processes, especially in the development of system details.

Keywords: City, Nature, Naturalness, Urban Ecology, Green Scenario, Naturalization.

1. INTRODUCTION

Today, the urban-rural balance is developing and differentiating dramatically at the expense of natural areas-rural areas. Natural environmental conditions are the main factors in the establishment of cities (Yaman & Doygun, 2014). The data arising from the location, topographical situation, climatic conditions, water elements, vegetation and natural environment of a city distinguish it from others, define it, make it unique and give identity to the city (Deniz, 2004; Kır, 2009).

Cities are ecosystems that contain natural structures and systems, and that involve the interaction of cultural and natural structures, in addition to being areas where anthropogenic activities are concentrated (Can, 1999; Uçkaç, 2006). Therefore, cities must maintain their ecosystem functions in a balanced and healthy way with planning practices that address cities with the perception of ecosystems. The Urban Paradigm Shift brings to the fore a "Nature-Oriented" urban scenario and emphasizes that cities, which are places of differences, protect ecosystems, water, natural habitats, and biodiversity; it is foreseen that there will be settlements that support sustainable consumption and production forms.

For the ecological, social and economic sustainability of our country's cities, green network systems will come to the fore as "critical infrastructures" in today's volatile and fragile urban environment. Green network and green infrastructure studies are on the agenda to analyze and integrate the ecologically based systems within our cities (Demirel & Velibeyoğlu, 2017). Despite the overgrowing/identifying structure of cities, the elements that make the city more unique, livable and with identity are green network systems, which can be defined as the ecological values of the city. The concepts of "green scenario" and "city within nature", which have been expressed in cities in recent years, are a natural result of these obligations and searches. In this sense, establishing green infrastructure networks and considering relevant nature-based design solutions will facilitate the process as a proactive step.

The fact that urban design projects prepared under the guidance of green infrastructure systems and nature-based solutions make a significant contribution to the solution of problems in detail and practice and that design concepts such as water-sensitive urban design (WSUD) and landscape urbanization (LU) are developing in this direction, will be evaluated in the determination between the different components in the urban spatial organization (Demirel & Oruçkaptan, 2018). In addition to the necessity of interdisciplinary work and cooperation between solutions in the specified design approaches, the subject will also be examined with examples in bio-engineering studies where relevant engineering fields are also involved in the design processes, especially in the development of system details.

2. Natural Environment and Occurrence of the Problem

The natural environment, or natural world, includes all living and inanimate beings that have come into being only by natural means. There are no completely natural environments on Earth. The opposite of the natural environment is the human environment. The human environment is where humans have transformed areas such as urban environments and farmland from the very beginning, and these places have been transformed by man into a substantially simpler human environment than the natural environment (URL, 2023a).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Global economic changes underlie the ongoing changes in the role of cities. Over the past fifty years, most cities in developing countries have grown with industrialization and subsequent urbanization practices (Sassen, 1998), and today's cities cover 2% of the earth's surface but consume 75% of the world's resources (Wiemann, 1996). Again, as a result of the solution of the housing and housing problem, which is the basic human need that manifested itself in the 20th century, through slumming and concreting in the aforementioned cities, irregular and unplanned urbanization, urban infrastructure and urban environment problems have emerged.

3. Compliance Process

In addition to being areas where anthropogenic activities are concentrated, cities are ecosystems that contain natural structures and systems, and involve the interaction of cultural and natural structures (Figure 1). Today, the urban-rural balance differs dramatically in favor of the cities. Depending on the effects of global climate change, the heat island effect, air pollution, flood disasters, green space deprivation, distribution and maintenance problems, biodiversity loss, desertification, drought and related deteriorating soil and water quality, food security show that the relationship of cities with nature needs to be reconsidered (Demirel & Oruçkaptan, 2018).

Figure 1. Formation of groundwater in natural conditions (URL, 2023b).

4. Urban Areas

There is a relationship between urban fabric organizations and infrastructure systems in urban areas.

- This relationship is particularly related to the decline of green spaces in urban areas and
- It has become even more important with the preference of impermeable surface coatings.

As a result of these preferences, superficial flow has occurred in transportation and construction and urban landscape areas. In parallel, the existing infrastructure systems, which continue with their limitations and problems, have become unable to manage water at high amounts and speeds with sudden rainfall.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Today, the question of how to achieve harmony between the cities that are the scene of intensive human use and ecology is sought to be answered, pushing all the interest groups that make up the city to think and question multi-dimensionally on the *concept of "ecological urban renewal and livable healthy city"* (Demirel, 2017).

Urban Planners, Landscape Architects and ecologists strive to recreate the natural values that have been diminished and lost within the city. The concept of "all green network elements covering the built environment and open spaces that exist within the city" is a natural consequence of these necessities (Figure 2).

Figure 2. Reducing urban heat islands (URL, 2023c)

- Management of high temperatures
- Water resources management
- Reducing the impact of river floods
- Reduction of soil erosion
- Coastal flood mitigation
- Living species need to create a space to adapt to new climatic conditions.

5. Solutions

Urban Criteria and Performance Indicators (Işıldar, 2012)

1/*Urban Sustainability Indicators* ": It is the first example to use the European Charter on Sustainable Cities and Towns as a framework. Steps were taken at the 1994 Aalborg Conference. It was developed within the framework of a study by Mega and Peterson's European Foundation.

2/*"International Eco-City Framework and Condition Levels"* document (IEFS) is prepared by "Eco City Builders" and established in 1992 and gathers many related organizations (national-international) under its umbrella.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

3/Green City Index: It was prepared by Siemens together with the Economist Intelligence Unit (EIU) based on the view that the responsibility for climate change lies with the cities.

Eco-Cities

Eco-cities, which have emerged with the aim of adding a new meaning to the city in the ecological sense, are system designs that bring together all the point solutions that come to mind for the city. Eco-cities, which are seen as the cities of the future with the principles of ecological approach respecting nature, aim to add a new dimension to the understanding of the city (Çetinkaya, 2013).

What is wanted to be achieved with the Eco-City Model is to provide multifaceted benefits from nature without disturbing the natural ecological balance and to implement them on the condition that they are at optimum level. The objectives of the eco-city system are: (Quoted from Çetinkaya 2013/ Berkes & Kışlalıoğlu, 2010).

- Reducing the Impact of the City on the Environment
- Use of Renewable Energy Sources
- Low Waste Production
- Use of Recycled Materials
- Minimizing the Ecological Footprint

This process, which started with the I.Habitat Conference (1976, Vancouver), has been addressed in an increasingly important dimension today with the Quito Declaration on "Cities for All" (17-20 October 2016, Quito, Ecuador/U.N., 2016) and great strides have been made for the livability of cities in a 40-year period. With the Quito Declaration which has *the vision of "environmental sustainability"* urbanization is today considered as the engine of sustainable and inclusive economic development, social and cultural development, nature and environmental *protection, sustainable development*. In the Ecological Urban Renewal and Naturalization studies, the ecological interventions given and conceptualized below and the way of managing natural components with the perception of ecosystems are given (Figure 3).

CONCEPTUALIZATION

Figure 3. Ecological interventions and their conceptualized (URL, 2023d).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

A/ Network of Wetland Habitats

Habitat connectivity is a landscape feature that is critical to biodiversity conservation in the face of climate change. Describes the ability of species to disperse or move between suitable pieces of habitat (URL, 2023e).

There has been a recent emphasis on new strategies for identifying and assessing the quality of wetland habitat linkage for wildlife. The graphic-theoretical approach treats wetlands as nodal points for mapping habitat connectivity and defining habitat networks (Figure 4) for ecological analysis. Examples of other approaches are given in Figure 5-11.

ABSTRACT

The physical environment of a city can have a significant impact on how people use and navigate through urban space. The construction materials play a crucial role in shaping the urban environment, pedestrian routes and experiences. One important factor in this regard is the material used for construction. Concrete, asphalt, brick, terrazzo and other materials all have unique aesthetics and tactile qualities that can influence the flow of pedestrian traffic and create distinct experiences within urban areas. The relationship between urban space, construction material, pedestrian traces and routes is complex and multifaceted. An approach to the use of construction materials can create a diverse and dynamic landscape that enriches urban life and encourages community engagement. While each of these factors has its own unique influence on a place, they are also deeply interconnected and can combine in unexpected ways to create rich and evolving urban environments. In this context, the aim of the study is to explore the relationship between urban space, construction materials and pedestrian traces and routes. The research draws on existing literature on urban design, architecture and environmental psychology. The study is based on a critical analysis of case studies of urban spaces in different cities around the world. The analysis considers how the use of different construction materials affects the way pedestrians move and interact with their surroundings. The paper argues that the careful use of construction materials can improve pedestrian movement and contribute to the creation of a more walkable, vibrant and sustainable urban environment.

Keywords: Pedestrian-Friendly City, Routes & Traces, Urban Experience, Inclusive Design, Construction Materials.

1. INTRODUCTION

Urbanization has led to a significant increase in the population of cities around the world. This has created a number of challenges for urban planners and designers, who must find ways to accommodate the growing number of people in a relatively small space. One key challenge is to design urban environments that are pedestrian-friendly and encourage walking as a means of transportation.

Three main groups of determinants of pedestrian movement and place activities related to street characteristics and the built environment could be identified:

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

1. Urban design and land use are of utmost importance for achieving high levels of pedestrian activities in the streets.
2. Streetscape design also matters.
3. The successful provision for pedestrian movement and place activities requires far more than pedestrian-focused urban and transport design (Gerike et al, 2021).

Measures aimed at improving pedestrian traffic conditions should be undertaken in a comprehensive manner and in parallel on many levels. This mainly applies to the implementation and improvement of street optimization standards, providing more space for pedestrians and functions that activate the public space. What is needed is spatial planning oriented on the development of pedestrian and public transportation as well as urban traffic organization based on the priority of pedestrian traffic and public transport (Wiszniewski, 2018).

The pedestrianisation strategy aims to revitalize city centres by creating a pleasant and functional public space, encouraging people to move in public space and communicate. The environment and pedestrian streets in cities must be designed to encourage people to walk daily. The plan should encourage people to look for work close to home, use the services around them and become part of the local community. Together, these factors would reduce the use of private cars (Vugule, 2021). Reducing vehicle traffic in the city centre, speed limits, pedestrianization, and spatial interventions that provide safe and comfortable access for pedestrians improve the walking experience, and shape the expectations and priorities of pedestrians regarding a walkable environment (Erturan & Aksel, 2022).

The speed of pedestrians, the perception of users, and the geometric-functional evaluation are useful parameters for the planning of pedestrians' structures. During the last few years, it has been quite difficult for designers to understand the relationship between the characteristic pedestrian flow and the pedestrian movement using only their experience and their senses. Interactions between pedestrians are difficult to understand and often the presence of closed or small spaces alters their behavior. The planning and the design of spaces in which pedestrians can move as they do in streets and squares must be considered as certain parameters in order to increase the perception of safety in users and therefore to make them more usable. Among these parameters, streets are the spontaneous surveillance that increases the offender's apprehension given by the risk of being seen by people (Campisi et al., 2020).

Pedestrian traces left behind by people also have a significant influence on urban space. As people move through an environment, they leave behind physical marks and traces that can shape the appearance and function of a place. Pedestrian traffic patterns can help determine where paths and sidewalks are constructed and where access points and gathering spaces are located. The marks left by graffiti artists, street performers and other non-traditional users of urban space also contribute to the overall aesthetic of a place, creating a sense of character and identity that is unique to each location. The routes taken by people as they move through urban environments can shape the way space is used and experienced. By following particular paths, people can create connections and relationships to certain places, while avoiding others. This can create distinct spatial patterns and hierarchies that help define the overall character of a location.

September 14-15, 2023, Naples, Italy

Construction material plays a crucial role in shaping urban space, as different materials can have significant impacts on the physical attributes of a place. For example, the use of concrete or glass can create sleek and modern-looking cityscapes, while the use of brick or stone can give buildings a more traditional and historic feel. The choice of architectural styles and building design can also have an impact on the form and function of urban spaces, from the sprawl of suburban municipalities to the dense clusters of high-rise buildings that dominate many metropolitan areas.

In this context, the purpose of this study is to explore the pivotal role that construction materials play in crafting pedestrian-friendly urban environments. By examining the impact of various materials on the physical, social and sensory aspects of urban spaces, it is aimed to shed light on the potential of construction materials to transform cityscapes into vibrant, accessible and engaging places for pedestrians.

The role of construction materials in shaping pedestrian-friendly urban environments extends far beyond their functional properties. They possess the power to influence the overall experience of pedestrians, contribute to environmental sustainability and foster social cohesion. Through a comprehensive examination of the relationship between construction materials and the urban realm, this study aims to inspire and inform urban designers, planners and decision-makers in their quest to create vibrant, accessible and people-centric cities of the future.

2. MATERIALS and METHODS

The literature on urban design and architecture highlights the importance of creating a built environment that is responsive to its users. This includes designing spaces that are safe, accessible and easy to navigate. The use of different construction materials can significantly impact the pedestrian experience.

For example, the use of hard surfaces such as concrete and asphalt can create a sterile and unwelcoming environment that discourages walking.

In contrast, the use of natural materials such as wood and plants can create a more inviting and comfortable environment that encourages people to walk. In this context, the aim of this study is to explore the relationship between urban space and construction materials and pedestrian traces and routes.

The study is based on a critical analysis of case studies of urban spaces in different cities around the world. The analysis considers how the use of different construction materials affects the way pedestrians move and interact with their surroundings.

The case studies include examples of successful urban spaces and the analysis focuses on identifying best practices and lessons learned. The research draws on existing literature on urban design, architecture and environmental psychology to inform the analysis.

In this study, various case studies, research findings and best practices from around the world to illustrate the transformative potential of construction materials in shaping pedestrian-friendly urban environment will be explored.

By analyzing the interplay between material selection, urban design and the pedestrian experience, it is aimed to provide insights and recommendations that can guide future urban development endeavors and foster the creation of more livable and sustainable cities.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

The Role of Construction Materials in Urban Environment

Urban space is a dynamic and constantly evolving concept that is shaped and influenced by a range of factors, including the choice of construction material used to build it, the pedestrian traces left behind by its inhabitants and the routes taken by people as they move through it.

Communication, coexistence, co-production, socialization, etc., which are one of the basic features of urban life. It also brings with it interactions. "Private" and "public" experiences interact with each other both directly and indirectly through their unique lifestyles and uses of space. In this context, squares and streets, which are the most important elements of the public space, are the most important components of the relationship established with the private (Biçer Özkun, 2017). As spaces where citizens get together and carry out leisure activities, public spaces are among the most important elements of a city. Streets are public spaces that provide for people's transportation needs as well as being places for socialization and sharing. Streets also offer essential facilities to citizens with their visual richness and aesthetics. Streets are public spaces that serve citizens as important elements of the urban image. As public spaces, streets can be distinct from other spaces or have an identity with the agglomeration of similar functions and/or structures from different or similar architectural periods (Ergen, 2013).

In the bustling and dynamic urban landscape, the concept of creating pedestrian-friendly environments has gained significant attention in recent years. As cities continue to grow and evolve, the need to prioritize the well-being and mobility of pedestrians has become a crucial aspect of urban planning and design. Central to this endeavor is the understanding that the selection of construction materials plays a fundamental role in shaping the urban realm and influencing the overall pedestrian experience.

Walking through a city is a multisensory experience that encompasses not only the visual aesthetics but also the tactile qualities and acoustic properties of the built environment. The choice of construction materials, such as paving stones, concrete, wood, or recycled materials, can significantly influence the way pedestrians interact with their surroundings. These materials can shape the comfort, safety and overall ambiance of streets, sidewalks and public spaces, ultimately affecting the quality of life and well-being of urban dwellers.

Moreover, construction materials play a crucial role in addressing environmental sustainability and resilience challenges in urban settings. The use of eco-friendly and locally sourced materials can reduce the carbon footprint associated with construction activities, promote resource efficiency and contribute to the overall environmental performance of cities. Additionally, the selection of materials with enhanced durability and resistance to wear and tear can help create long-lasting urban spaces that withstand the test of time and contribute to the sustainable development of our cities.

It is also essential to consider the social dimension as well. The choice of materials can communicate cultural identity, enhance a sense of place and foster a connection between individuals and their urban surroundings. By carefully selecting materials that resonate with the local context and reflect the aspirations of the community, urban designers and planners can create inclusive and culturally rich environments that promote social interaction and a sense of belonging among pedestrians.

In conclusion, the development of pedestrian-friendly urban environments relies heavily on the thoughtful selection of construction materials. From ensuring safety and comfort to creating

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

aesthetic appeal, fostering sustainability, promoting social interaction and embracing technological advancements, construction materials play a multifaceted role in shaping the urban realm. By recognizing the transformative potential of materials, urban designers, planners and decision-makers can create vibrant, accessible and people-centric cities that prioritize the well-being and mobility of pedestrians.

The Careful Use of Construction Materials in Urban Environment

The careful use of construction materials can improve pedestrian movement and contribute to the creation of a more walkable, vibrant and sustainable urban environment. The use of different construction materials can significantly impact the pedestrian experience. For example, the use of natural materials such as wood and plants can create a more inviting and comfortable environment that encourages people to walk. The use of hard surfaces such as concrete and asphalt can create a sterile and unwelcoming environment that discourages walking.

In addition, concrete is often used for large-scale infrastructure projects, like highways and bridges. Its smooth surface allows for easy movement of vehicles while also serving as a durable surface for pedestrians. However, the starkness of this material can also contribute to a lack of warmth and character in the urban environment. Asphalt, meanwhile, is commonly used for roads and sidewalks. Its dark color can absorb heat and make urban areas feel hotter, but it is also relatively inexpensive and easy to maintain. Its smooth surface provides a relatively even terrain for pedestrians. Brick and terrazzo, on the other hand, offer a more tactile experience. These materials provide a textured surface that can be more comfortable for walking, but can also become uneven and potentially hazardous if not properly maintained. They also lend a warmer, more human-scale feel to public spaces, which can encourage people to linger and socialize in these areas.

Designers should consider the impact of different materials on the pedestrian experience when designing urban spaces.

Enhancing Safety and Comfort

The selection of construction materials significantly impacts the safety and comfort of pedestrians in urban environments. For instance, the choice of non-slippery, well-maintained paving materials can reduce the risk of accidents and falls, ensuring a safer walking experience. The use of materials with shock-absorption properties, such as rubberized surfaces or innovative pavement designs, can enhance walking comfort, reducing fatigue and minimizing the impact on joints. By prioritizing pedestrian safety and comfort through the thoughtful selection of construction materials, cities can create inclusive and accessible environments that encourage active modes of transportation.

Creating Aesthetic Appeal and Identity

Construction materials are instrumental in creating the aesthetic appeal and identity of urban spaces. The careful selection of materials that harmonize with the architectural style and cultural heritage of a city can evoke a sense of place and strengthen the visual character. For example, the use of locally sourced materials, such as natural stone or timber, can celebrate the region's unique identity and create a distinct sense of authenticity. Integrating artistic and innovative materials, such as decorative tiles or sustainable murals, can infuse urban spaces with creativity and invite pedestrians to engage with their surroundings on a deeper level.

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Fostering Sustainability and Resilience

In an era of increasing environmental consciousness, the role of construction materials in promoting sustainability and resilience cannot be overstated. The choice of eco-friendly materials, including recycled or reclaimed materials, can significantly reduce the carbon footprint associated with construction activities. Additionally, the use of permeable paving materials allows for natural water infiltration, mitigating stormwater runoff and contributing to urban water management. By adopting materials that are durable, low-maintenance and energy-efficient, cities can reduce the environmental impact of their infrastructure while creating resilient and long-lasting pedestrian-friendly urban environments.

Influencing Social Interaction and Engagement

Construction materials have the potential to influence social interaction and engagement among pedestrians. The design and selection of materials can encourage people to gather, linger and interact within public spaces. For instance, incorporating seating elements made from sustainable materials or using art installations as focal points can create opportunities for socializing and community building. By choosing materials that invite touch, such as textured surfaces or interactive elements, cities can foster a deeper connection between individuals and their urban environment, promoting a sense of ownership and pride.

Embracing Technological Advancements

The rapid advancement of technology offers new opportunities for the role of construction materials in shaping pedestrian-friendly urban environments. For example, the integration of smart materials, such as self-healing concrete or photovoltaic pavement, can enhance functionality and sustainability. These materials can detect and repair cracks autonomously or generate renewable energy, contributing to the overall efficiency and resilience of urban spaces. By embracing technological advancements in construction materials, cities can create innovative and future-ready environments that adapt to the changing needs of pedestrians.

The Examples of Careful Use of Construction Materials in Urban Environment

The selection of construction materials plays a vital role in shaping the pedestrian-friendly urban environment. High-quality materials that are visually appealing, durable, slip-resistant and comfortable to walk on contribute to the overall experience of pedestrians and promote a sense of safety and livability in cities. The examples below demonstrate how the selection and integration of construction materials in street and pedestrian way designs can significantly contribute to shaping pedestrian-friendly urban environments.

Barcelona's Passeig de Gracia

The wide sidewalks of Passeig de Gracia in Barcelona are paved with high-quality materials such as granite or natural stone. These materials not only provide a visually appealing ambiance but also offer a durable and slip-resistant surface for pedestrians. The careful selection of materials enhances the pedestrian experience and promotes walkability (Figure 1).

Seoul's Cheonggyecheon Stream

Cheonggyecheon Stream is an urban renewal project in Seoul that transformed an elevated highway into a pedestrian-friendly waterway. The stream is lined with various construction materials, including natural stones, concrete and steel, which provide a visually appealing and durable surface for pedestrians to walk along. The integration of bridges, seating areas and art installations further enhances the pedestrian experience, creating a serene and engaging environment amidst the bustling city (Figure 5).

4. CONCLUSION and RECOMMENDATIONS

The role of construction materials in shaping pedestrian-friendly urban environments is undeniably significant, extending far beyond their functional properties. Through careful selection and innovative design, these materials have the power to transform cities into vibrant, accessible and engaging spaces for pedestrians.

First and foremost, construction materials play a pivotal role in enhancing safety and comfort for pedestrians. By choosing non-slippery, shock-absorbing and well-maintained materials,

TeMALab

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

cities can create environments that minimize the risk of accidents and reduce fatigue, encouraging more people to walk and engage in active modes of transportation. A safe and comfortable urban environment is not only beneficial for individuals but also contributes to the overall livability and vitality of a city.

Furthermore, construction materials contribute to the aesthetic appeal and identity of urban spaces. By selecting materials that reflect the cultural heritage and architectural style of a city, designers and planners can create environments that evoke a sense of place and pride. The integration of locally sourced materials and the incorporation of artistic elements add depth and authenticity to urban spaces, inviting pedestrians to connect with their surroundings on a deeper level.

In the pursuit of sustainability and resilience, construction materials offer immense potential. The use of eco-friendly and locally sourced materials reduces the environmental impact of construction activities and promotes resource efficiency. Additionally, the adoption of durable and low-maintenance materials ensures the longevity of urban spaces, contributing to the sustainable development of cities. As humanity faces the challenges of climate change and urbanization, the selection of resilient materials becomes crucial in creating urban environments that can withstand the test of time and adapt to evolving needs.

Moreover, construction materials have the power to influence social interaction and engagement. By incorporating materials and designs that encourage gathering, seating and interaction, cities can foster a sense of community and belonging among pedestrians. The tactile qualities of materials, combined with interactive elements, invite people to engage and explore their urban environment, promoting social cohesion and a sense of ownership.

Lastly, the rapid advancement of technology opens up new possibilities for the role of construction materials in shaping pedestrian-friendly urban environments. The integration of smart materials, with their self-healing capabilities, energy generation potential and data-driven functionalities, can revolutionize the way of design and experience in the cities. Embracing these technological advancements allows to creation of innovative and future-ready urban spaces that adapt to changing needs and provide sustainable solutions.

In conclusion, the role of construction materials in shaping pedestrian-friendly urban environments is multifaceted and transformative. By harnessing their potential, cities can create inclusive, sustainable and people-centric environments that prioritize the well-being and mobility of pedestrians. By embracing the power of construction materials and integrating them into holistic urban planning approaches, the cities that are not only functional and efficient but also beautiful, resilient and responsive to the needs and aspirations of their inhabitants can be built.

ABSTRACT

Georg Simmel perceives ruins as nature's triumph over human-made artifacts, symbolizing the collapse of tools and institutions through which humanity has sought to capture and regulate life. As time erodes matter, it concurrently dismantles the illusion of a stable form. If architecture is acknowledged as a cultural construction, driven by the pursuit of stability and permanence, as suggested by Georges Bataille, decay not only deforms the physical manifestation of architecture, but also challenges the epistemological constructs the discipline serves. Decomposition undermines rigidity, rules, and predictions, revealing the formless concealed within architectural form. Thus, formlessness, brought forth by decay, emerges as a critical field, parallel to the role Bataille assigns to the concept of "informe (formless)". Within this framework, this study aims to explore architectural decay, discussing the subject by alluding to Albert Speer's concept of "ruinenwert (ruinvalue)" and Bernard Tschumi's argument that architecture harbors its own decay as it encompasses both prescriptive aspect of design and experiential aspect of use. Thus, the paper endeavors to examine ruination as the emergence of formlessness within architectural form, thereby to discuss decay as a challenge to the inherent intentions within the field of architecture.

Keywords: Formlessness, Architectural Form, Architectural Decay, Bataille, Simmel, Tschumi.

1. INTRODUCTION

Interest in architectural decay has been steadily growing in the 21st century. While the fascination with ruins has been relevant since the advent of archaeology, the epistemological and semantic aspects of decay have predominantly gained attention over the past two centuries. One of the most significant contributions to the semantics of decay can be found in Georg Simmel's definition. In his article titled "Die Ruine", Simmel (1911) perceives decay as the consequence of the ongoing battle between human-made forms and nature. For Simmel, ruination is not only the formlessness of matter but also the triumph of nature's inherent form over humanity's creations. Consequently, the ruin becomes an expression of humanity's defeat against nature, or rather, the collapse of the tools and institutions through which civilizations seek to organize life.

Thus, by shattering the illusion of humanity's ability to structure and design the world, decay dismantles the illusion of a stable form, rendering all constructions formless. Therefore, decay

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

does not merely deteriorate matter, but also the epistemological constructs, including those of architecture, by introducing the formless.

Within this perspective, this study aims to explore architectural decay while examining ruination as the emergence of formlessness within architectural form. In doing so, it seeks to discuss decay as a challenge to the inherent intentions within the field of architecture.

2. The Concept of Formlessness

As the intended investigation necessitates a revisit to the definitions of "form" and "formless", the study anticipates the concepts as interpreted by Georg Simmel and Georges Bataille, respectively.

Simmel (1918) asserts when life transcends the realm of biological existence to enter the mental realm, it produces specific artefacts, or forms. Spontaneous life, to some extent, requires these forms to exist as an entity, since life, being inherently formless, "can only manifest itself as a phenomenon by being given form" (Simmel, 1918). However, cultural constructions (or forms), generated within the flow of life, solidify, become independent, and attempt to impose order onto the variable, unpredictable and flexible flow of life itself, thereby entering into an opposition with it. Simmel (1918), therefore, identifies a conflict between life and the forms it produces when he argues that form is the opposite of life.

Bataille (1929b) assigns a similar role to forms when he asserts the world is inherently formless, while all social constructions attempt to impose a form, or give "a mathematical frock-coat" onto the world. He writes:

"In fact, for academic men to be happy, the universe would have to take shape. All of philosophy has no other goal: it is a matter of giving a frock coat to what is, a mathematical frock coat." (Bataille, 1929b).

By his definition, Bataille further assigns a critical role to the concept of "formless (*informe*)", in opposition to the "architectural order" that imposes a structure onto the universe. According to this interpretation, architecture, emerging as a potent form for organizing and framing life, not only reflects social constructs but also serves as the initiator and sustainer of cultural institutions. In his brief text "Architecture", Bataille (1929a) explains how architecture operates as a vehicle for achieving absolute social consensus by purging the environment of its differences to regulate life. Indeed, the chaotic and formless aspects of the world are eliminated through architectural practice, resulting in the stabilization and organization of the environment.

However, as demonstrated by Simmel, architecture, as a cultural construct, contradicts the dynamics of life- its transience, variability, and diversity. This perspective emerges from his theory of a conflict between life and forms. Simmel writes:

"With each and every new form of existence which it creates for itself, its perpetual dynamism comes into conflict with the permanence or timeless validity of that form. Sooner or later the forces of life erode every cultural form which they have produced." (Simmel, 1918).

Decay emerges as a natural force of spontaneous life that erodes architecture, thereby revealing the formless and challenging the narratives edifices have been carrying. In this regard, ruins demonstrate the inevitable conflict between the perpetual dynamism of life and the impulse of architectural forms to remain fixed and eternal.

3. Ruins, as the Antitheses of Monuments

While ruins have occasionally been romanticized as aesthetic objects throughout history, they serve as poignant reminders of the collapse of the forms and institutions through which humanity has organized the chaotic world. Therefore, it is unsurprising to witness various efforts aimed at restoring them to their former glory, in an attempt to preserve the permanence of these forms. Walter Benjamin's apprehension of Paul Klee's painting "*Angelus Novus*" aptly illustrates how humanity endeavors to restore these forms to their initial state. Benjamin writes:

"This is how one pictures the angel of history. His face is turned toward the past. ..., he sees one single catastrophe which keeps piling wreckage upon wreckage and hurls it in front of his feet. The angel would like to stay, awaken the dead, and make whole what has been smashed. ... This storm irresistibly propels him into the future to which his back is turned, ... This storm is what we call progress" (Benjamin, 1940).

The *Angelus Novus*, or the "Angel of History" as designated by Benjamin, demonstrates how the passage of time transforms matter into ruins. While the Angel of History attempts to recuperate these ruins, the winds of progress, or the relentless passage of time, compel him to leave them behind to proceed towards the future.

DeSilvey & Edensor (2013) refer to ruins as "counter-sites", highlighting their potential to undermine and critique manifestations of power. Furthermore, decay liberates forms from their initial ideals, allowing them to be perceived anew by modern beholders who infuse them with novel meanings. This perspective aligns with Alois Riegl's notion of "age value". In his "*The Modern Cult of Monuments*", Riegl (1903) defines "age value" in opposition to the "historical" and "commemorative values" assigned to monuments. Age value emerges from the natural decay that artworks bear, rendering the passage of time visible. While commemorative value is dictated by the deliberate intentions of a monument's creators in its original form, age value is conferred by the modern viewer. Consequently, age value arises when the passage of time distorts the values and meanings associated with the artwork, illustrating that natural forces not only alter the monument itself but also the very intentions and narratives it carries. Riegl (1903) also notes how the conservation processes counter age value. In this vein, Allais (2013) characterizes conservators as "formless keepers" who seek to restore the form to its initial state to control the viewer's experience with the architectural object.

Albert Speer, however, introduces an alternative approach to "formless keeping"—one that does not entail restoration but rather the deliberate design of the passage of time. Speer developed the concept of "*ruinenwert* (ruinvalue)", an idea also embraced by Hitler, in the 1930s. This concept entails designing a building "to appear aesthetically pleasing even in a state of ruin" (Speer, 1970), with the intention of creating a "bridge of tradition" for future generations. In this context, the complete collapse of a structure was undesirable. Instead, through careful structural calculations and material choices, it was envisioned that even centuries or millennia later, a building could become a ruin yet still reflect the "grandeur" of its era, akin to Roman ruins embodying the "splendor" of their time (Speer, 1970) (Figure 1).

Figure 1. Speer, *Große Halle* (Great Hall), model, 1939 (Bundesarchiv, Bild 146-1986-029-02 / CC-BY-SA 3.0).

Clearly, Speer's concept of "ruinvalue" encompasses more than simply allowing nature to reclaim structures and relinquishing control over them (Stead, 2003). Ultimately, material selection and construction technique facilitate controlled decay. This control over the future ensures that, even as the form crumbles, its ideals remain intact. Designing the moment of decay becomes crucial for the continuation of the form, as incorporating deformation into the construction is essential to prevent the dissolution of stability. As in the case of Roman or ancient Greek monuments, when a ruin transforms into an aesthetic object, it ceases to function as an artifact that is capable of challenging humanity's assumption of rational progress (Trigg, 2006), so it no longer is an object that reveals the fragility and potential deformation of the world structures.

Architecture, in fact, can stabilize its own form to the extent that it overcomes the nullifying power of ruins through the maintenance of monuments. Consequently, one could argue that ruin is the ultimate antithesis of monument (Stead, 2003).

4. Decay as an Inherent Aspect of Architecture: the Perspective of Tschumi

In this case, the term "ruin value" can be regarded as architecture's assimilation of its opposite by incorporating it into its essence, given that ruins contradict monuments. Tschumi (1976), however, to the contrary, asserts that architecture inherently harbors actions and phenomena that undermine and disrupt its established conventions, leading to its dissolution. Hence, decay is a domain already encompassed by architecture. Tschumi (1976) elucidates how the moment of decay is immanent within the structure itself, manifesting through its use and experiential aspects. According to his theory, decay indicates the point where the "spatial praxis meets mental constructions" (Tschumi, 1976). He designates "transgression" as the point where architecture negates its own conventions. The building, through its physical existence, entails or even induces actions that will lead to its deterioration. Within this context, while one could argue that these actions and phenomena might indeed be considered integral to the building, the question remains: are they truly a part of architecture?

The dilapidated state of Villa Savoye (1928) during the post-war era provides an illuminating case for discussing this question. In the opening section of Tschumi's article "Architecture and Transgression", he presents a poster featuring a photograph from the series "Advertisements for Architecture (1975)", depicting the derelict condition of Villa Savoye in 1965 (Figure 2). In the poster, he claims that the "most architectural thing" concerning the structure is its condition

TeMALab

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

of deformation (Tschumi, 1976). Beneath the image depicting the abandoned residence, the following inscription is found:

“Architecture only survives where it negates the form that society expects of it. Where it negates itself by transgressing the limits that history has set for it.” (Tschumi, 1976).

Figure 2. Tschumi, advertisements for architecture (1975) (Tschumi, 1976).

Villa Savoye, a symbol of modern architecture's residential ideals, had transformed into a state of dereliction during the 1950s (Figure 3). Madame Savoye was compelled to vacate her residence in 1940 due to the occupation of France by Nazi Germany. Upon her return after the war, she resided in the house for a period; however, due to the technical and functional predicaments the house harbored, she once again abandoned it. Describing the state of the residence during the 1960s, Blake (1960) characterizes it as "a strange and rather tragic ruin", offering the following depiction:

"What remains of the Villa Savoye today is, ...: a streaky, grey, rectangular box of reinforced concrete, under this concrete box, ..., there is now a hideously ugly pile of junk that looks, more or less, like the local village dump."

Upstairs, inside the great concrete box, ...; most of the windows are boarded up; much of the floor area serves as a hayloft. Most of the paint has flaked off the walls; white splotches of plaster have appeared next to the original pastel blue. The patio, in the centre of this upper floor, is part hayloft, part weed garden.

Finally, the roof structure, this is a composition of straight and curved concrete screens and forms, now as pale and flat and desolate as the rest –flaking paint, streaked concrete, rusty railings, weeds everywhere." (Blake, 1960).

Figure 3. Villa Savoye in 1959, (photo: Rene Burri, 1959) (Source: Archiwik).

Blake's description illustrates how the Modern Architecture's timeless, abstract, hygienic, pure and geometrically universal form has transformed into a ruined structure filled with debris. The decayed state of Villa Savoye fundamentally undermines the taboos of modernism, primarily because Modern Architecture typically renders time imperceptible and anticipates the perpetual endurance of forms, while Villa Savoye has manifested the passage of time through its deformation (Jormakka, 2005). Furthermore, designed with a functionalist and rationalist ethos, the residence ironically had issues regarding function and construction, contributing to its abandonment (Jormakka, 2005). In a sense, as Tschumi's statement suggests, it negated "the form that society expects of it" (Jormakka, 2005). As the quintessential embodiment of modern design, this dwelling exposes its state of decay as an embodiment of the deterioration of Modern Architecture's all utopian aspirations and ideals. It stands as a testament to the dismantling of the form that Modern Architecture sought to impose, ultimately evolving into formlessness.

On the other hand, Tschumi (1976) highlights another aspect within the state of decay, which is the relevance of architecture's capacity to concurrently encompass the state of excess (i.e., its decay) in both rational and sensuous aspects. In another poster from the "Advertisements for Architecture" series, he presents a photograph of the interior space of the ruined Villa Savoye and inscribes that when architecture is taken to the excess, it will simultaneously "reveal both the traces of reason and the sensual experience of space" (Tschumi, 1976).

What fascinates Tschumi (1976) about Villa Savoye is the coexistence of logic and sense within the same space, which he perceives as an "architectural condition". The state of decay, viewed by Tschumi as integral to architecture itself, unveils the formless concealed within form, thereby revealing the extraordinary within the ordinary. Thus, decay becomes an act of surreal existence. Indeed, Blake (1960) characterizes Villa Savoye's decayed state as a "lovely, surrealist dream existence", describing it as "a delightful ruin".

In this context, decay becomes a tool for unlocking the potential concealed within architecture while simultaneously opening the building to viewers to infuse it with new meanings. Then, one may argue that decomposition possesses the capacity to reconcile two distinct historical paradigms. One is the aspect lived and experienced by modern observers, while the other is the notion documented and propounded by historians (Allais, 2013).

Thus, akin to the concept of age value coined by Riegl, deformed structures that bear the marks of the passage of time, are more amenable to receiving new meanings rather than imposing the narratives of their creators and era. This transformation is not solely attributed to the passage of time or the forces of nature, but is also induced by the actions of users. Consequently, this is the point at which Tschumi's assertion gains credibility, since the building inherently encompasses its own formlessness, considering that both usage and time, each in its own right, contribute to decay.

Nevertheless, while Tschumi perceives this moment of decay as an integral aspect within architectural design and even contends that the act of decaying is the "most architectural thing" within it, one may argue that the moment of decay is, in fact, the juncture at which the building diverges most decisively from architectural practice itself. It is precisely for this reason that Speer, by integrating the moment of departure from architecture into the building's structure, seeks to incorporate decay as an element of the structure and, consequently, a constituent of its form. For the decay of the building, both physically and symbolically, its deformation, is akin to a strike on its initial form. In this case, the deformation and decay within the flow of life might indeed correspond, contrary to Tschumi's assertion, to "everything non-architectural" and remain "outside" the realm of architecture. It shatters all rigidity, all rules, all predictions of the architectural construct. Architecture cannot encompass it, thus demonstrating that this challenge can only exist outside the sphere of architectural practice.

Perhaps the issue lies not solely in designing spaces that enable various experiences to coexist within a form; perhaps the crux of the matter lies in life's struggle against form, as identified by Simmel, and the actualization of the virtualities embedded within the existing structure.

5. CONCLUSION

In this exploration of architectural decay, ruination has been elucidated as the emergence of formlessness within the framework of architectural form, thereby positing a challenge to the intrinsic intentions of architecture, as well as the conventional apprehension of architectural object as an enduring, stable form. The study underpins its argument on the acknowledgement of the concepts "form" and "formless" as they have been expounded by Simmel and Bataille in the early 20th century. Simmel's insights into ruins highlight the conflict between human-made structures, or forms, and the forces of nature, unveiling how decay disrupts not only physical substance but also the epistemological constructs. If architecture is acknowledged as a cultural construction, as posited by Bataille, then decay not only challenges the physical manifestation of architecture but also the narratives it conveys. The role Bataille ascribes to the concept of formless is also pivotal in this regard, as he explicates form as a mathematical frock-coat that regulates all facets of life. He further emphasizes that architecture, as a form-creating practice, assumes a pivotal role in imposing order upon the formless world.

From this vantage point, in pursuit of stability, order, and permanence, architecture stands in stark contrast to ruins, which may be perceived as the antitheses of monuments. Therefore, architecture might only preserve its form by incorporating the destructive forces of nature, as illustrated by Speer's concept of "ruinvalue", which advocates for a controlled decay of edifices. By designing buildings that retain their aesthetic appeal even in a state of decay, Speer sought to bridge tradition across generations. This approach demonstrates a deliberate effort to govern the process of decay and maintain the form even when the edifice succumbs to the passage of time.

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

On the other hand, Tschumi's perspective challenges the conventional comprehension of decay, asserting that it is an inherent facet of architecture itself, encompassing both the prescriptive aspects of design and experiential dimensions of use, thereby harboring moments of decay and formlessness. Consequently, Tschumi perceives decay as a negation of acknowledged architectural form, implying that it transgresses the historical boundaries of the discipline. However, this assertion prompts a pivotal inquiry: Does decay truly belong within the realm of architecture, or does it represent a departure from it? The ruined state of Villa Savoye during post-war era poses a compelling elucidation to this question. The dilapidated building renders all ideals of Modern Architecture futile. It renders the passage of time visible, while Modern Architecture aspires to permanence. The abandoned structure, reclaimed by nature, stands in stark contrast to the idealistic, white, hygienic geometric boxes of Modern Architecture.

Ultimately, the concept of architectural decay challenges the traditional boundaries of architecture and engenders contemplation regarding the relationship between form and formlessness. It underscores the dynamic and evolutionary nature of human-constructed structures and the enduring conflict between the yearning for permanence and the inevitability of decay. Architectural decay invites us to reevaluate the role of time, nature, and life itself in shaping the built environment and encourages a deeper exploration of the formless within the realm of architecture.

ABSTRACT

The concept of space is a human construct, which is the sum of the boundaries created within the natural environment for a specific purpose or need. At the same time, spaces are an expression of the organization that embodies the social relationship that human life establishes with its immediate environment. Spaces, which encompass human relations and the various subcomponents of these relations during daily life and host different processes of life, are places where perceptions and experiences transform into consciousness, character and memories. Therefore, spaces are equipped with the meanings and identities that people attribute to them. However, spaces can sometimes lose their physical and existential opportunities they provide to people due to different natural disasters, especially earthquakes. This study presents temporary modular "basic living unit" proposals that offer flexible use, easy to produce and install, portable, healthy, comfortable and economical, "shelter" function-prioritized solution alternatives for disaster victims. In this context, it focuses on the design process addressed within the scope of the "Modular Systems" course of Istanbul Galata University Department of Interior Architecture and Environmental Design in the Spring semester of 2022-2023. Through the process of experimentation and the presentation of the selected final works, it opens the subject to discussion as an important design problem with the aim of consideration and diversification. Four designs selected among the projects developed by the students during the fourteen-week semester constitute the sample of the study. Thus, it was tried to create safe and meaningful living environments for the user which temporarily meets the need for shelter in a short time after the disaster.

Keywords: Modular systems, flexible design, basic living unit, adaptive space, interior architecture.

1. INTRODUCTION

"...by leaving the space of one's usual sensibilities, one enters into communication with a space that is psychically innovating."

Gaston BACHELARD (Poetics of Space: 206)

Architectural design is a phenomenon that should be handled in a holistic system from building form to spatial elements. In addition to meeting all the physical, cultural, psychological and even aesthetic needs of the user, the adaptation of the design to different conditions has become one of the most important parameters expected from an architectural design, especially today.

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

The dictionary definition of adaptation is "the action or process of changing something, or of being changed, to suit a new purpose or situation" (Oxford Learner's Dictionary, 2023). In 2020, the pandemic that affected the whole world has already reminded the importance of such spaces. Various design solutions have been developed on flexibility in spaces that need to transform to be used for many functions at the same time or at different times of the day (Turgay, 2022). Similarly, the earthquake disaster, which poses a very serious danger for Turkey, has once again underlined the concepts of adaptation and flexibility in design, especially for the post-disaster period.

The vibrations caused by the fractures under the earth's crust are called "earthquakes" when they spread as waves and shake the earth and the environments they pass through (Atabey, 2000). Considering the geographical structure of Turkey, it is known that Turkey is located in a very active earthquake zone and has experienced many earthquakes in its history. 95% of the population of our country is at risk of earthquakes, the majority of the population is located in earthquake zones, unplanned construction, and the society does not have sufficient awareness and knowledge about earthquakes cause the loss of life and property to reach great dimensions in earthquakes (AKUT, 2008). As the possibility of similar earthquakes in the future is predicted by scientists, human beings will be inadequate in combating such natural disasters unless the necessary awareness and rational solutions are realized.

Many of the places where people realize their most basic need, shelter, have the possibility of being partially or completely destroyed due to earthquakes caused by the continuous movement of tectonic plates due to the physical structure of the earth, inappropriate spatial structures and interior space constructions (Doğan, 2020). During the Kahramanmaraş Earthquake in our country, in which thousands of people lost their lives, unfortunately, many of our citizens' houses collapsed or were damaged. As in the aftermath of previous major earthquakes, creating habitable spaces for the many people left homeless by the disaster is a problematic of great importance for the discipline of architecture. Various answers have begun to be sought for temporary housing solutions that are suitable for single individuals, crowded families, married couples or nuclear families, suitable for all seasonal conditions, where daily activities can be easily carried out, which provide storage and can be produced quickly.

There are many examples of post-earthquake temporary housing around the world. The common points of these designs, in which housing, educational and religious building functions are the majority, are lightweight materials, mostly prefabricated, dismantlable when necessary, fast and easy to produce, easy to transport and install (Halıcı, 2023; DAC, 2023). In addition to these, the building should be organized spatially correctly and should be able to meet the physical, psychological, hygienic, personal, social and aesthetic needs of the user (Beyatlı, 2010). Furthermore, since the post-earthquake period will be characterized by the creation of a living space consisting of many units rather than a single living unit, how the units will come together and what kind of texture they will form is as important as designing the unit itself.

The design question that emerged at this point, briefly defined as "creating relatively "comfortable" living units that can be reproduced as needed in a short period of time for users with different populations and different lifestyles", was the subject of the Modular Systems Course at Istanbul Galata University, Department of Interior Architecture and Environmental Design, in the spring semester of 2022-2023. Under the title "Modular basic living unit", the students designed flexible living spaces supported by movable elements by creating a module

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

that can be multiplied and diversified. This study aims to emphasize the importance of the concepts of modularity, adaptability and flexibility in spatial design by presenting the projects created within the scope of the aforementioned course to the literature. It is thought that the resulting basic living units can form the basis for many different contexts such as minimal living spaces, nomadic life, or even sustainable living spaces, especially the temporary shelter units after the earthquake we are currently in.

Module and Modular Systems

As a human construction, space is a fiction that is the sum of the boundaries set within the natural environment for a specific purpose or need where actions such as protection, sheltering, warming, etc. can be performed. They are expressions of the organization that embodies the social relationship that human life establishes with its immediate environment. Space, which is the equivalent of shelter, protection and refuge, which is the most basic need of human beings as a social being, is also an indicator of belonging to a class, status or class identity in the society, apart from the first functional approaches within the framework of the modern age. Therefore, the places where people live, work and socialize are determined and organized according to the dynamics of their socio-economic and socio-cultural structure.

Today, thanks to developing technology, new production methods and smart materials, it is possible to obtain higher quality, long-lasting, high-strength and economical structures. Especially with the understandings brought by industrialization, standardization in production appears as an indispensable necessity. As a requirement of standardization, the concept of "module" and understandings such as "modular coordination" have emerged. The search for harmony in aesthetic unity, which has been going on since ancient times, started with the "Golden Ratio / Golden Section" and took its current form with Le Corbusier's concept of "Modulor" based on aesthetic unity and human dimensions. Le Corbusier's concept of "Modulor" is accepted not only as a set of harmonious numbers, but also as a set of measurements that governs lengths, surfaces and volumes, bringing the human proportion to the forefront under all circumstances. It is determined and organized according to the dynamics of the structure (Tokgöz & Koçak, 2008).

The concept of module is briefly a definition of a unit. Each of the entities that make up a multiplicity is a unit or a subdivision that forms a fiction. It is a concept adopted in the production of building elements and materials in order to facilitate their assembly, minimize material consumption and provide economic benefits. The modular design approach can reduce the cost of increased variability in the production line if it results in different versions of the product by combining old and new versions of different subsystems (Mikkola, 2000). Today, it is also referred to as a dimensional value unit in order to ensure dimensional coordination in the harmonious combination of different building materials. The concept of modularity is a system created by using modules together. Modules that are similar to each other in proportion come together in a certain order and form the design. The concept of modularity in spatial design is considered as an organization system formed by the arrangement of similar elements (Pala Azsöz & Kaprol, 2022).

A standard building component is expected to fit into the overall system. Therefore, standard components of all different sizes can only be of value if they are produced in coordinated dimensions. It is therefore necessary to provide a dimensional framework for standards in the construction process, a modular coordination (Tokgöz & Koçak, 2008; Sedihemaiti & Tokman,

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

2021). Modular coordination is a standardization technique that is applied in order to reach a certain standard unit of measurement of horizontal or vertical dimensions with the general coordination dimensions of the building components produced; with the building components of the various spaces and building elements in the building and allows dimensional coordination to be realized (Gökhan & Baytin, 1979). Modular coordination is very important in terms of combination details from the design stage to the application stage and the combination of different elements in a certain harmony.

2. MATERIALS and METHOD

The material of this study is selected projects created within the scope of the "İÇM 308 Modular Systems" course conducted by the authors in the spring semester of 2022-2023 at Istanbul Galata University, Department of Interior Architecture and Environmental Design. The design problem has been determined as a "basic living unit" that can emerge as an alternative solution to human living spaces or meet basic living needs in post-natural disaster processes. The unit is expected to be easy to produce, portable, installable, transportable, and constructed as a lightweight structure using different material combinations. In this context, the process consists of three stages (Figure 1).

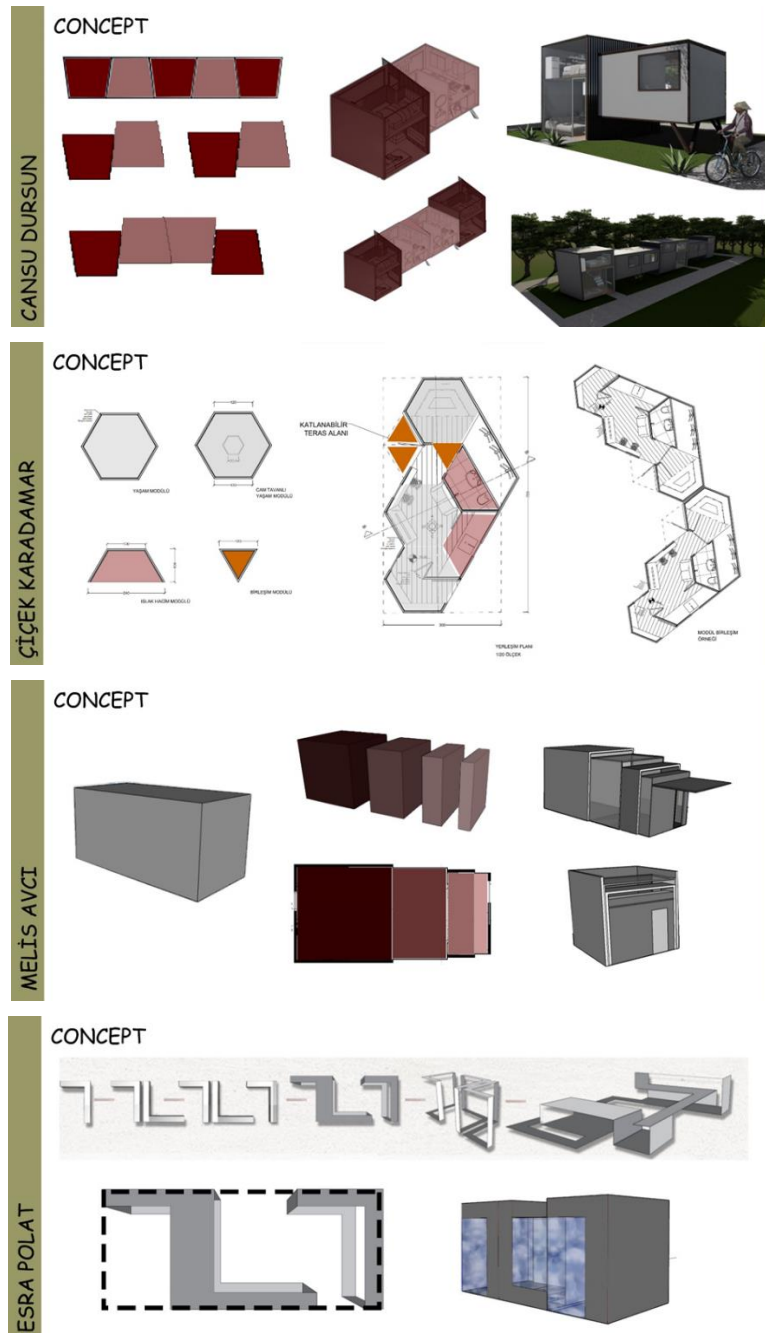

Figure 1. Stages of module design

In the first stage, students were asked to create a "unit/module" in the form of their choice, provided that they stay within the limits set as 360cm width, 720cm length and 360cm height, and to create an order within the framework of this module by using the phenomena of coordination, harmony and unity. At this point, it was emphasized that the modules should be designed as both add-removable and foldable structures that can produce flexible space solutions for different uses, diversify according to the user population and create a pattern that allows social communication when they are multiplied. In addition, attention was drawn to the lightweight structure of the form, the character of the material to be selected, and the adaptability of the unit to different topographies. While designing the three-dimensional form of the module, in addition to adhering to the inspired concept, discussions were held on the correct determination of the heights required by the users in line with their daily activities, the location of the mezzanine floor if needed and the psychological effects of the space on the user. At the end of this four-week process, the students prepared concept sheets in which they explained the form of their modules, the stages of the emergence of the module and the patterns with drawings, diagrams and graphs. The examples you will see below are the projects of students who have successfully managed the process.

September 14-15, 2023, Naples, Italy

Figures 1-4. Concepts of selected projects (credit to Cansu Dursun, Çiçek Karadamar, Melis Avcı, Esra Polat)

In the second phase, which lasted eight weeks, students were asked to design spaces for living, sleeping-resting, working, storing, feeding and hygiene needs within the module. Unlike the "room" or "cell" concept in traditional housing units, these spaces were encouraged to be more flexible and permeable, with no clearly defined boundaries, such as "space within space", "space that can transform into each other" and "moving space". For the aforementioned spaces, different features such as "fixed/mobile", "transformable/transportable", "modular" were sought, especially in the surfaces, furniture and equipment that would give that space its

September 14-15, 2023, Naples, Italy

function. At this stage, students were especially encouraged to research all modular systems required for a basic living unit, to examine examples and to meet with application experts. At the end of the process, the students presented the spaces they designed on the sheets they prepared with drawings, three-dimensional visuals and diagrams.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

The third and final phase lasted two weeks. In this process, students were asked to solve the system details of the interior of the module they designed. Material selection, lighting, custom-made furniture and system details were revealed through technical drawings and graphic descriptions.

3.FINDINGS and DISCUSSIONS

When we examine the discipline of Interior Architecture in terms of education, the fact that it is both intellectual, imaginative, fictional and theoretical brings the concept of creativity, which is a situation that requires multidimensional thinking, to the forefront. Defining the design problem given in the design process well, drawing the framework clearly, developing the

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

design, and ensuring that the final product is the most rational solution. As a result of the participation of technology in this process, as well as many other parameters participating in the design process, some changes are taking place in studio culture and design education. Design can also be characterized as a concept that is constantly changing, changing form, developing and transforming, as opposed to what is done by wondering, asking questions and questioning. The most important outcome of the act of design is "learning". In light of all these, design is a field where purpose-oriented, unconventional ideas are produced, discoveries are made, and in this way, the designer reveals his point of view in the face of the "situation" with the activity of "learning" as an inference.

Throughout the semester, various positive and negative points emerged within the framework of understanding the design problem correctly and in detail, defining the user profile and related requirements, and realizing technical details and drawings in line with a concept to be selected.

The biggest achievement of the students in this process is to comprehend the importance and convenience of modulation in design. In particular, they have seen the difference between standardization and custom construction in order to produce rational designs that are far from being random, to make faster, easier and more economical designs, and they have faced the existence of problems such as ensuring coordination between different elements, materials and even equipment of the building. Spatially, they tried to think in terms of flexibility and transformation instead of rigidity. Again, instead of a singular, abstract design approach, they searched for a design with features such as multiplication, articulation and adaptation by coming together and thus developed their design perspectives.

The act of designing is usually realized through a "source of inspiration", often accompanied by an intense fictional process. While the design envisioned in the mind is transformed into a final product and comes into existence concretely, what is revealed is not only what is in the designer's creativity, but also the reflections of the source of inspiration, which is the starting point of the design. In this direction, many of the students were confused about where to start when it came to creating a "unit/module", which is the first action of the design problem. There were only a few who were able to come up with bold approaches to reaching the form and the source of inspiration. There was also the difficulty of structurally constructing the module and creating different variations of this module, and establishing a coordination between them. The students, who generally gravitated towards more defined geometries such as squares, rectangles and hexagons, were still not clear about creating a system for a long time, even though they dealt with more defined geometries. In addition, many of the students who imagined non-Euclidean forms lost their mastery of the geometries they wanted to obtain by adding-subtracting or deconstructing from basic shapes.

Another problem encountered by the students was in spatial solutions; the concept of flexible space, which offers approaches that are rational, elaborate and can be transformed into different functions, was not fully grasped. Rather, conventional spatial solutions were considered and potentials were not questioned much. Spatial flexibility and adaptation were considered by many students only within the limits of movable furniture, and the alternatives for planar, linear and point elements that will form the flexible space were not sufficiently examined. Besides, students did not make enough progress in the use of lightweight materials and in producing solutions that provide easy and fast production and assembly.

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

In today's design education and professional environments where design is practiced, two-dimensional drawings and models, which are traditional means of expression, have been replaced by various modelling programs that can be navigated in three dimensions, making it possible to experience design in a more interactive way. The most obvious advantages of computer use in terms of design education can be listed as easy production, saving time, increasing creativity with the help of various programs, representing design knowledge in different ways, and developing more systematic approaches in the design process. On the other hand, computer-aided designs begin to resemble each other both functionally and aesthetically due to the fact that the furniture and equipment blocks in these programs are identical. For this reason, it was observed that the students who skipped the sketching stage and worked with straightforward computer drawing had more of the above-mentioned faltering.

The projects presented in this study and the approaches that have successfully completed this process, contrary to the solutions that have not been captured by other studies above, have emphasized ergonomic and anthropometric points by questioning all these issues. In these examples, spatial adaptation has been taken out of the boundaries of furniture and equipment and addressed with its dimensional, topographical and organizational dimensions. In addition, the designs were considered together with technical features such as ease of assembly and material selection. These students endeavoured to find form through traditional sketching methods before the computer-aided design process, and managed both technical drawing and three-dimensional expression techniques well in the process of expressing the design.

3. CONCLUSION

The aim of design studios is to reveal creativity, to develop the ability of the mind, eye and hand to work together, to create design solutions by assimilating the formal, spatial and structural information obtained from other courses during the academic year. The design studio is a structure that is enriched by discussions and interactions in which all kinds of information enters at any time and does not remain as it enters, but changes with the previous experiences of the designer, the way of thinking, the way of looking at events. Another of the main objectives of studio education is to examine and structure the relationships between design, imagination and concept. The interaction between the more experienced academician and the student constitutes the basis of studio education. What happens in the studio is not a design process under the control of a single person, but the organization of a collaborative process involving mutual interaction. At this stage, transforming a simple "idea" into space and integrating it into a simple tectonic language is one of the most difficult steps in an often complex process.

Considering design as physical, intellectual and temporal reminds us that the parameters that make up design are related to perception and sensation as much as they are related to a context; that space is imagined, constructed and built. A designer's inclusion of people's perceptions, expectations and comments in the design process, in addition to observing the behavior of users and evaluating the demands, will provide a serious infrastructure and remind us that design is for people. Students who do not acquire this awareness are likely to offer spaces that do not see the user at the centre and solutions that are not suitable for the user in the future. There is a danger in projects disconnected from the user.

In this context, the study you have read has revealed the process and results of a design problem based on a painful reality that exists in the world and especially in our country. The design

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

reactions of the students were observed against a design problem based on principles such as the meaning of the space in the user, its adaptability to the conditions it is in, its flexibility according to the user profile, it's easy and fast manufacturability, and its assembly. The importance of modular design and adaptive space within the framework of post-earthquake sheltering was once again emphasized. With the enrichment of similar studies in the future, it is hoped to develop new and different alternatives for rational, functional and creative living spaces that are not independent from the user.

ABSTRACT

Historical buildings and their contents are universal as being the common value of all humanity as well as the context and culture to which they belong. Fire, which is one of the biggest factors in the destruction of these buildings, causes losses of life, property, documents transferring to future generations, and the collective memory. Therefore, it is essential to minimize the fire risk of historical buildings and to ensure fire safety before and during the disaster without damaging the original characteristic of the building. In addition, the measures which depends on the content and application methods should not cause any damage on human health, built and natural environment before and after the fire. This study aims to evaluate fire interventions in historic buildings and identify the approach that causes the least damage to the building, its contents, and the environment. In this study, the basic principles of fire interventions in historical buildings were stated; and impact values of the interventions on the building, contents and users were compared. Firstly, the impacts of firefighting techniques appropriate for historical buildings are examined under several headings which are load on building, the effects on component/content, human health, environment, and safety. The required information were obtained from Department of Fire Brigade, material safety data sheets taken from the material manufacturers, and suppliers. As a result, the firefighting techniques which cause the least damage to the historical building, its contents and users were identified, and suggestions were presented in this regard.

Keywords: Historical Buildings, Firefighting, Impact Assessment.

1. INTRODUCTION

Historical buildings ensure the transfer of information about the social life levels of the periods that constitute the immovable cultural heritage. For this reason, they become the common heritage of all humanity. Therefore, historical buildings and their contents should be protected without damaging the building and its contents. Fires in historical buildings cause great damage to the building and the valuable materials it contains. Therefore, it is crucial to ensure fire safety in historical buildings. The factors that constitute the fire risk in historical buildings require a two-pronged approach in terms of ensuring life safety and protecting items. In this respect, many portable and built-in extinguishing agents are used to extinguish and control buildings such as museums, galleries, cultural centers, libraries, and houses to protect them from fire.

It is observed that firefighting approaches may have a great impact on the historical fabric as much as the fire itself. Haydarpaşa Train Station building, which has witnessed history for more

than a century and is one of the important symbols of Istanbul, burned down during the restoration works on 28 November 2010, and the roof section was severely damaged (Figure 1). In the extinguishing process, the roof of the building was intervened with water from the sea via helicopters and ships. The water used for extinguishing purposes had caused extra damage to the building because the pressure of the salty water was corrosive (Figure 2). In addition, the excessive amount of water caused deposits in the building and the decorations on some of the ceiling tiles were damaged (Ünal & Gündoğdu, 2011).

Figure 1. Haydarpaşa Train Station burned down on 28 November 2010 due to a short circuit in the electrical installation (Source: www.denizhaber.net)

Figure 2. Deterioration in the ceiling due to extinguishing the fire (Source: Istanbul No. 5 Cultural Heritage Preservation Board Regional Directorate Archive)

Another example is Galatasaray University, which is a historical building in Istanbul. It burned down on 22 January 2013, due to the faulty installation of the electrical system, and the second floor and roof of the building were destroyed by the effect of the flames. The extinguishing teams intervened from both land and sea to prevent the fire from spreading to the surrounding buildings. The flames in the historical building, where wooden materials were used intensively, were extinguished with difficulties. As a result of the extinguishing processes with intensive water cannons, serious damage occurred in the building (Figure 3). Consequently, the fire started on the second floor through the wooden walls with a natural convection movement (chimney effect). After that it spread to the roof, and it could not be noticed early because there were no detection and alarm systems on the roof of the building (Kılıç, 2013).

Banner School in Oklahoma City, burned down on 11 May 2014 due to lack of attention and negligence. The historical school which built in 1935 was severely damaged. The dry chemical powder used to extinguish the fire caused additional damage to the items inside (Figure 4)

Figure 4. The dry chemical powder extinguisher caused residues and puddles on the items in the historical building. (Source: <https://blog.qrfs.com/211-guide-to-fire-extinguisher-clean-up/>)

There are not enough studies in the international literature on the risks posed by extinguishing methods to the historical building. However, some of the important studies on the subject are as follows. In a study comparing fire extinguishing techniques in terms of human health and environmental impacts, Hodges & McCormick (2013) examined the effects of water, Halon 1301, Heptafluoropropane (HFC-227ea) and dry chemical powder combined with fluorocarbon (CF) (FK-5-1-12) agents. The main purpose of the study is to compare the performance of existing extinguishing agents with environmentally friendly alternatives. In this context, more than 150 tests were carried out indoors and outdoors and the results were evaluated. According to the results, it has been observed that other fire extinguishing agents are not as effective as Halon 1301 and HFC 227ea in meeting the requirements of the US army, but Halon 1301 gas causes significant harm to human health and the environment.

In another study examining the effect of fire extinguishing agents on building materials in historical buildings, Zhou et al. (2023) experienced and analyzed the effects of extinguishing elements containing hydrogen fluoride (HF) on surfaces of historical building materials. For this purpose, 5 hydrogen fluoride-containing quenchers (H-37, FK-5-1-12, H-1323, H-2402 and H-1301) were examined by comparing Fourier Transform Infrared Spectroscopy (FTIR) measurements. As a result, deposits were found in the pores on the wooden surfaces, depending on the amount of fluorine contained in the extinguishing elements, and it was determined that HF caused extra damage to the building content due to its corrosive effect.

Xiaomenga et al. (2010) explained the effectiveness of the water mist system in extinguishing flammable liquid and wood fires with theoretical and experimental methods in their study titled "Extinguishing the Fire Extinguishing Performance of Water Mist Fire Extinguishers in Historic Buildings". The study examined the relationship between water mist and smoke and thermo-physical interaction according to fuels (diesel, gasoline, and wood materials). As a result, it has been concluded that the extinguishing process changes as the properties of the water mist extinguishing system such as flow density, droplet speed and droplet diameter, and that it will be possible to protect historical buildings and users from fire with water mist equipment with appropriate features.

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

The main objective of this study is to compare the effects of fire interventions in historic buildings and identify the least damaging approach in terms of the load on the building, the building component/content, the environment, and the impact on human health.

2. MATERIALS and METHODS

Technical information about 9 different approaches used for extinguishing fires in historical buildings was obtained from the fire departments. The safety data sheets of the materials were gathered from material manufacturers and suppliers. These approaches were compared under the headings of the load their equipment creates on the building, the impact on the building component/content, the impact on human health, environmental impact, flash/explosion effect and electrical impact (Table 1). The first of these criteria is the load created by the extinguishing elements on the building. The force acting on the building during an earthquake is directly proportional to the building weight. Therefore, as the building weight increases, the effect of the earthquake will increase relatively (URL-10). For this reason, it should be aimed to reduce the load of the extinguishing elements on the building. Similarly, since the protection of building components against fire is as important as the protection of human health and the environment, these criteria have been determined. In the context of these criteria, the approach that has the least impact on the building and its content was determined and recommendations regarding fire safety were made.

Table 1. Effects of fire intervention approach [URL-1,2,3,4,5,6,7,8]

Fire Intervention Methods	Load on Building	Effect on Building Component/Content	Effect on Human Health	Environmental Impacts	Flash/Explosion	Electrical Conduction
Dry Chemical Powder Extinguishers [URL-1,2]	The load imposed on the building by mobile tubes, which vary between 1-50 kg, is negligible.	The compounds they contain, NaHCO ₃ , KHCO ₃ , NH ₄ H ₂ PO ₄ , can corrode surrounding surfaces and leave stains.	It has no negative effects on human health.	It has known negative effects indoor outdoor environments.	When the compound NH ₄ H ₂ PO ₄ reacts with different chemicals, it can cause explosions by releasing flammable gases.	The molten compounds formed during the quenching process can generally pose a danger because they can conduct electricity.
Foam Extinguishers [URL-1,6]	The load imposed on the building by mobile tubes, which vary between 1-50 kg, is negligible.	They can be cleaned easily.  September 14-15, 2023, Naples, Italy

	compared to others.
Manual Water Extinguishing [URL-1,9]	Cellulose and Accumulated textile water products absorb excessive amounts of water and accumulate, creating load on the building. It has no negative effects on wood and stone materials of rot and stain due to moisture problems. It has no negative effects on human health. It has negative effects on indoor and outdoor environments. It has no In closed Contact with electronic devices cause them to malfunction and become completely unusable.
Extinguishing with Halon Gases [URL-1,7]	They need more extinguishing agents, pipes, tanks. Therefore, they create additional load on the building as they take up more space than others. Extinguishin g systems with halon gases do not leave residue and do not create pollution. It has no negative effects on human health. It seriously damages the ozone layer because it contains chlorofluorocarbons (CFC). Its use is prohibited in many countries. There is no danger of flash explosion. Halon gases do not conduct electricity, so they do not pose a danger. However, spraying may cause static electricity generation immediately.

When the table is examined, it is seen that extinguishing systems containing water do not have a negative impact on the environment and human health. However, due to the amount and speed / pressure of water, its accumulation in the indoor environment can cause damage to the building by creating an extra load. Nonetheless, it should not be overlooked that accumulated water causes mold and mildew. Water, which has no danger of flashing or exploding thanks to its physical and chemical properties, can cause an increase in pressure due to high temperature in closed areas, thus bringing the risk of explosion. In addition, water conducts electricity when mixed with substances that can be separated into ions or when it is not pure. It may cause malfunctions in electronic devices. Halon gas causes damage to the ozone layer due to the Chlorofluorocarbon (CFC) it contains. In addition, the need for many tanks and pipes poses a problem in terms of the load it will create on the building. Foam extinguishers cause skin and eye irritation due to the ethanol (C₂H₅OH) they contain. Carbon dioxide gas can harm human health as it makes breathing difficult during the extinguishing process. Extinguishing with sand is not preferred frequently because it is primitive and slower than others. In line with all these criteria, it appears that water extinguishing systems are the least damaging approach among other extinguishing agents. However, it was concluded that automatic extinguishing systems that intervene as soon as the fire starts, prevent its spread in a short time and minimize the damage that may occur are more suitable than manual water extinguishing systems. The automatic sprinkler system creates a disadvantage in terms of the load it imposes on the building

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

as it requires more pipes and heads than the water mist extinguishing system. In addition, the water droplet size in the automatic sprinkler system is larger than the water mist extinguishing system, which can cause puddles.

When all approaches are analyzed according to the criteria stated in the table, it is understood that the water mist extinguishing system has the least number of disadvantages compared to the others in terms of building, user, and content safety. (Figure 5).

3. CONCLUSION and RECOMMENDATIONS

Automatic water extinguishing systems are one of the most effective ways to protect against fire because they are faster than manual water extinguishing systems. In addition, since water mist extinguishing systems have very small droplets, they trap more heat and reduce the temperature of the environment faster than other methods.

For this reason, it is recommended to use water mist extinguishing methods for the protection of historical buildings against fire. However, risks such as excessive amounts of sprayed water or water pressure damaging the items inside should be taken into consideration.

In addition, extinguishing systems in historic buildings should be designed with great care to fully respect the original fabric of the building. It is also advisable to build fire barriers with water mist systems to prevent the spread of fire. In this way, the fire barriers will block the heat and protect the building and its contents from fire within a certain period.

In this context, further theoretical and experimental studies are needed to determine the full potential of extinguishing systems to position the safest, aesthetic, and cost-effective extinguishing systems in historic buildings.

ABSTRACT

The objective of this study is to highlight the impacts of the public open green space and private enclosed spaces as break spaces on the autonomic nervous system and the study performance of three graduate students using the Pomodoro technique for time management during their studies. The general aim of the research was to establish a relationship between break space characteristics and study performance. We sought to understand how different break spaces influenced overall study progress following the Pomodoro study pattern. Research on environmental enrichment has demonstrated that when animals are exposed to heightened sensory, cognitive, motor, and social stimuli, it leads to behavioral, cellular, and molecular transformations. Nevertheless, limited research on the neurophysiological effects of environmental enrichment in humans exists. This paper focuses on the built environment as a crucial aspect of environmental enrichment and gathers evidence supporting the beneficial impact of green spaces on human well-being. Currently, to assess the impact of an outdoor green environment on body performance, three students from a class were analyzed individually in separate settings under controlled conditions. They utilized the Pomodoro technique and recorded relevant data regarding their body performance after each interval for four consecutive days at fixed hours. In summary, green outdoor spaces may have a positive impact on the autonomic nervous system during break time in a Pomodoro study pattern. Exposure to natural environments during breaks may contribute to stress reduction, relaxation, improved attention restoration, and overall well-being.

Keywords: Polyvagal Theory, Autonomic Nervous System, Pomodoro Technique, Break Space Quality.

1. INTRODUCTION

The impact of environmental factors on human well-being and performance has been a subject of interest in various fields, including psychology, education, health sciences, and architecture. One crucial aspect of this research focuses on understanding how different environments, such as green outdoor spaces and indoor built-up spaces, can affect physiological responses and overall functioning.

In this study, we examine the data collected from 3 students. The autonomic nervous system plays a vital role in regulating involuntary bodily functions, including respiration, heart rate, and stress responses. By analyzing parameters such as respiratory rate, heart rate (pulse), pain perception, tension in the neck and shoulder muscles, and task performance, we aim to gain insights into how the environment influences these physiological indicators. Previous research has highlighted the potential benefits of green spaces on mental and physical well-being.

The general method employed in our research involved conducting an experimental study to investigate the impact of break space characteristics on the autonomic nervous system and study performance. We compared the effects of public open green spaces and private enclosed spaces as break areas, considering various factors such as greenery, natural lighting, ventilation, temperature, noise levels, and overall ambiance.

The general outcome of our research was to gather data and draw conclusions regarding the influence of break space characteristics on the autonomic nervous system and study performance. We aimed to contribute to the existing knowledge on the significance of environmental factors in creating conducive break spaces for optimal learning and well-being. Specifically, we compare the data collected during study and break periods in the exterior and interior environments. By analyzing parameters such as respiratory rate, heart rate, pain perception, tension in the neck and shoulder muscles, and task performance, we aim to uncover any differences between the two settings. Understanding the influence of the environment on physiological responses and task performance has practical implications for designing optimal learning and working environments. By identifying which settings are more conducive to promoting well-being and productivity, we can potentially enhance educational and work environments to support individuals' overall health and performance. In the following sections, we will delve into the specific data collected from students.

Theoretical Framework

Environmental Neuroscience is a multidisciplinary field that investigates the influence of the environment on human well-being and physiological responses. Numerous studies have highlighted the significant impact of the environment on various aspects of human health and functioning. Ulrich's seminal study in 1984 demonstrated that exposure to natural views through windows positively influenced recovery from surgery, suggesting a connection between nature and healing processes. Building upon this work, subsequent research has further explored the benefits of engaging with nature.

Pretty et al. (2005) found that engaging in outdoor activities, known as "green exercise," resulted in improved mental and physical health outcomes.

Similarly, studies by Van den Berg et al. (2010) have indicated that green spaces act as buffers against the negative effects of stressful life events, promoting better health outcomes.

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

Furthermore, Williams et al. (2018) conducted a systematic review and meta-analysis, establishing a relationship between the built environment for housing within the socio-economic status and non-communicable diseases.

The Autonomic Nervous System

Research study investigates how different aspects of green spaces influence the autonomic nervous system, which controls involuntary bodily functions. It regulates various physiological processes in the body without conscious effort (Waxenbaum, J. A., Reddy, V., & Varacallo, M. 2019). The study employs an experimental design to examine the physiological responses of individuals when exposed to varying characteristics of green spaces.

This experimental study exposes participants to different green spaces with varying characteristics. These characteristics could include vegetation density, biodiversity, visual complexity, naturalness, or the presence of water elements (Keniger, L. E., Gaston, K. J., Irvine, K. N., & Fuller, R. A. 2013). The researchers measure physiological indicators of autonomic nervous system activity, such as heart rate, blood pressure, or electrodermal activity.

Nature therapy has emerged as a potential approach to alleviate stress and enhance overall well-being in the past few years. It refers to a collection of methods that aim to induce "preventive medical effects" by exposing individuals to natural stimuli, facilitating physiological relaxation, and strengthening compromised immune functions to ward off illnesses (Jo, H., Song, C., & Miyazaki, Y. 2019).

The scientists can evaluate the influence of various traits of green spaces on the autonomic nervous system by examining the participants' physiological reactions (Lee, J., Park, B. J., Tsunetsugu, Y., Ohira, T., Kagawa, T., & Miyazaki, Y. (2011). For instance, they might discover that exposure to green areas with more abundant plant life or a higher level of natural elements results in a more robust parasympathetic response, indicating a state of greater relaxation. Conversely, green spaces with sparse vegetation or less visual intricacy could produce a stronger sympathetic response, indicating increased arousal or stress.

Polyvagal Theory

Polyvagal Theory (PVT) is a theory proposed by Dr. Stephen Porges, a researcher in the fields of psychology and psychiatry. The theory is based on the idea that the vagus nerve, which plays a critical role in regulating the autonomic nervous system, has evolved over time to allow humans to respond adaptively to social and environmental challenges. According to the Polyvagal Theory, the vagus nerve is divided into two branches, the dorsal vagal complex, and the ventral vagal complex, each associated with distinct physiological and behavioral responses. The dorsal vagal complex is associated with immobilization and shutdown responses, while the ventral vagal complex is associated with social engagement and communication. The theory proposes that the ventral vagal complex is particularly important for human social behavior, including the regulation of facial expressions, vocalizations, and other social cues. The Polyvagal Theory has been influential in the fields of psychology, psychiatry, and neuroscience, and has led to a better understanding of the role of the autonomic nervous system in social behavior and emotional regulation.

The attention given to 'the freeze mode' of Polyvagal Theory has increased in recent years. The theory explains that the dorsal vagal complex activation can lead to a freeze response, which has been characterized by an increase in immobility and a decrease in somatic (mind-body

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

connection) activity. The freeze response is interpreted as a form of adaptive behavior that enables survival during threats (Porges, 2011).

Many studies according to Van der Kolk et al. (2007) have examined the role of the freeze mode response in different populations. An example of that is a study of individuals with posttraumatic stress disorder, it was reported that many participants felt disconnected from their bodies and unable to respond to threats during the trauma, which is known as a freeze mode.

Another study of children with a history of abuse conducted by Grasso et al. (2016) found that those with severe experience of abuse were more likely to show signs of a freeze response/mode during a stress-inducing task.

Other studies such as Farber et al. (2018) have explored the neural correlates of the freeze response. They used functional magnetic resonance imaging (fMRI) to identify brain regions that were activated during a pain task designed to elicit a freeze or fight-or-flight response. Their findings show that the dorsal anterior cingulate cortex, associated with attention and emotional regulation, was more active during the freeze response than during the fight mode.

The fight mode is another physiological response apart from the freeze response, which occurs when the nervous system perceives a threat. According to the Polyvagal theory, this response is always controlled by the sympathetic nervous system of an organism. The body usually increases the adrenaline and cortisol production that prepares it to confront the perceived threat and defend itself (Kemp et al., 2017). Kemp et al. investigated the modulation of the cardiovascular system in response to facial expressions of happiness and anger. They found that facial expressions with anger induced an increase in heart rate, which is indicative of a fight-mode response.

Kim et al. (2020), concluded that music can induce fight-mode responses in individuals, which subsequently lead to changes in their heart rate variability. In their study, individuals listened to five different types of music genres, and the results indicated that the controversial music genre aroused the highest levels of fight mode responses. The study suggested that engagements such as listening to music can be used as a therapeutic tool to modulate the PVT response in individuals.

Social Engagement Mode

The social engagement mode, also known as the ventral vagal complex, is associated with feelings of safety, trust, and connection. This state is characterized by an active social engagement system, in which facial expressions, vocalizations, and nonverbal cues are used to communicate and establish meaningful connections with others. Activation of the social engagement mode is associated with increased heart rate variability, improved cognitive processing, and enhanced emotional regulation.

Research has consistently highlighted the importance of the social engagement mode in promoting healthy social interactions and positive interpersonal relationships. By engaging in social engagement behaviors, individuals are better able to establish and maintain connections, build social support networks, and experience a sense of belonging. This mode also facilitates the development of social skills, empathy, and emotional intelligence.

Several studies have investigated the effects of social engagement interventions on various populations, including individuals with autism spectrum disorder (ASD) and those with social

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

anxiety. For example, research by Porges and his colleagues (2013) demonstrated that interventions promoting social engagement, such as music therapy and social interaction training, can lead to significant improvements in social behavior and communication skills in individuals with ASD.

Moreover, the social engagement mode has been linked to positive mental health outcomes. In a study by Kok and Fredrickson (2010), individuals who reported more frequent experiences of social connection and positive emotions exhibited increased vagal tone, indicating a higher activation of the social engagement mode. This finding suggests that engaging in positive social interactions can promote psychological well-being and resilience.

The Pomodoro Technique

The Pomodoro Technique is a popular time-management strategy that has gained widespread use in various contexts, including education, business, and personal productivity. The Pomodoro Technique is a time management method developed by Francesco Cirillo in the late 1980s. It is based on the idea of breaking work down into short, focused intervals (usually 25 minutes) separated by short breaks (usually 5 minutes). The method is named after the tomato-shaped kitchen timer that Cirillo used as a student to time his work intervals. The Pomodoro Technique has been shown to improve productivity and focus, reduce procrastination, and enhance work-life balance. However, while many individuals have reported positive outcomes using this technique, there is limited empirical research investigating its effectiveness, for example, Ismail et al. (2022) prove the efficiency of the Pomodoro technique on English students during Zoom classes. This experiment aims to investigate the impact of the Pomodoro Technique on productivity and cognitive performance, using a randomized controlled design. Specifically, we will compare the performance of participants who use the Pomodoro Technique to those who work without structured intervals. By examining the effects of the Pomodoro Technique on cognitive outcomes, this study seeks to provide empirical evidence to support the use of this popular time-management technique.

The fundamental tenet of the Pomodoro Technique is that working in short, concentrated bursts enhances concentration, lessens procrastination, and boosts overall productivity. It keeps people motivated and avoids burnout by segmenting jobs into small chunks and including regular breaks.

Space and Impacts

Kuo, et al (2001) discuss the link between exposure to green outdoor spaces and a reduction in mental fatigue, which they found to be leading to decreased aggression and violence. In their effort to differentiate the sympathetic and parasympathetic activity of Autonomic Nervous System responses by viewing green and built scenes, Van den Berg, et al (2010) used laboratory study (electrocardiography and impedance cardiography signal) on 46 students, the study indicates a greater recovery by viewing green space pictures compared to built spaces.

Abdulhamid, et al (2022) used an adaptive immersive tool named “exobuilding” to measure the accuracy of the behavior of people with alexithymia and concluded it is beyond conscious interoceptive activities.

According to van den Berg et al. (2015), The study indicates that viewing urban green space for five minutes can support recovery from stress by enhancing parasympathetic activity. These findings strengthen the growing evidence base for the health benefits of green space in the

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

living environment. However, more research is needed to further understand the physiological and psychological pathways leading from viewing green space to recovery from stress. Their study examined the autonomic nervous system responses to viewing green and built settings, specifically differentiating between sympathetic and parasympathetic activity. The study indicates that viewing urban green space for five minutes can support recovery from stress by enhancing parasympathetic activity. These findings strengthen the growing evidence base for the health benefits of green space in the living environment. However, more research is needed to further understand the physiological and psychological pathways leading from viewing green space to recovery from stress.

2. DATA AND METHODOLOGY

An experimental study will be conducted to collect data from 3 participants during the break & study time in a Pomodoro study pattern.

The participants will be assigned to a green space existence condition for 2 days or a non-green space existence condition for 2 days for data collection individually. The green space existence condition will involve similar green space in the break space environment. The physiological and psychological parameters of participants will be measured using calculations, giving numbers as a self-report. The situation progress and well-being of participants in settled parameters will be assessed using standardized tables and questionnaires.

As part of the class, our team conducted an experiment to examine the influence of break space characteristics on the autonomic nervous system and study performance.

Research Questions

- What are the differences and similarities between the effects of green outdoor spaces and indoor spaces on the internal parameters autonomic nervous system of a human body during break time using a Pomodoro pattern of study?
- How does the existence of green space impact the parameters of individuals during the break time in a Pomodoro study pattern?
- How does exposure to natural versus built environments during breaks impact my stress levels and overall working progress during Pomodoro experiments 2 inside-2 outside break weeks on Sundays?
- What is the impact of studying in the same place but breaks in a natural environment (park, garden, campus) on my body's response compared to spending break time in a room?
- How we can improve the quality of spaces using a study of the human body between relaxation and study periods in green spaces
- Do green and open spaces have the same recovery of mind and body results as home spaces?
- Can someone improve the home spaces' efficiency using the different decorations?

Aim and Objectives

- To investigate the influence of green space existence on the physiological and psychological parameters of individuals during break time in a Pomodoro study pattern.

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

- To compare the effects of green space existence on cognitive restoration and mental fatigue during the break time in a Pomodoro study pattern.
- To examine the relationship between green space existence and the perceived stress levels of individuals during break time in a Pomodoro study pattern.

Preliminary Studies

During the preliminary stages of the research, a series of lectures were conducted during which the students were exposed to terminologies, self-awareness, and the process of data collection. A tool in the form of a table or form was constructed using the measurable characteristics of the autonomic nervous. The form was tested and modified, by removing irrelevant and immeasurable parameters. One of the challenges of this experiment is that the observer and the sample under study are the same people. So in the first place, one needs to learn how to collect the data from self without allowing his mind to temper or distort the accuracy of the data being collected.

Self-Observation Experimental Study

Our study involved examining the impact of break space characteristics on the autonomic nervous system and study performance. We focused on comparing public open green spaces and private enclosed spaces as break areas. By collecting data and analyzing the physiological and psychological parameters, we aimed to determine the influence of these spaces.

The study was conducted over a period of four days. Each day, the study commenced at 10:00 AM and ended at 3:55 PM. There were 2 indoor breaks of the study with 2 outdoor breaks of the study, in total 4 days of data collection day.

In our research, we utilized pictures to represent the different break space characteristics, providing visual representations of the spaces under investigation. These visuals helped us analyze their potential influence on the autonomic nervous system and study performance.

To conduct the research, our team followed an experimental study design. Each team member, with the consultancy of the teacher and the three students, participated as research subjects. We assigned individual participants to either the green space condition or the non-green space condition, and data collection took place over four days. During the study and break periods, we adhered to the Pomodoro Technique guidelines for time management.

Data collection was carried out by measuring various physiological and psychological parameters associated with the autonomic nervous system. These included respiratory rate, heart rate, pain levels, tension in the neck and shoulders, and performance/achievement on study tasks. Each team member maintained a record of their experiences and noted any occurrences of back pain throughout the experiment.

During the study, participants were encouraged to maintain a spontaneous eating and drinking routine. Breaks were provided at specific intervals to ensure participants had the opportunity to consume food and beverages. The duration of these breaks was set at 10 minutes, and participants could choose to eat and drink during this time.

Participants were allowed to consume food and beverages of their choice during the breaks. While there were no specific restrictions or guidelines on the types of food allowed, we will discuss the consumption of sugar and caffeine. Some participants opted for foods or drinks that

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

contained sugar or caffeine. However, the precise details of individual consumption varied based on personal preferences.

Cortisol, a hormone associated with stress, can be influenced by various factors, including caffeine consumption. In our study, we did not specifically measure cortisol levels. However, previous research in the field has indicated that caffeine intake can potentially affect cortisol levels and stress responses in some individuals. The relationship between caffeine and cortisol levels can vary depending on individual differences and other contextual factors.

Throughout the study, participants were encouraged to be aware of their physical condition and report any changes or discomfort they experienced. Physical condition descriptions varied among participants, but common indicators included muscle tension (such as neck and shoulder tension), and back pain as discomfort. These observations were noted and included during the data collection and analysis process.

3. RESULTS

Student A

The data collected during the experiment on student 'A' generally indicated a slight positive change in the state of the autonomic nervous system parameters under consideration at the break taken in green outdoor spaces than in the indoor built-up spaces. The parameters examined include respiratory (both type and rate), heart rate (pulse), pain on a body part or organ, tension on the neck/shoulder, and performance/achievement on the study tasks carried out between the breaks. The data has shown that the type of breath in both cases (green outdoor and indoor built spaces) remains the same which is diaphragmatic. The respiration rate fluctuates but the average in the outdoor green space is 19.64/minute, while in the indoor built space is 20/minute. The average heart rate in green outdoor space is 64.2/minute, while in the indoor space is 65.4/minute. Much stress and tension on the neck and shoulder were recorded in the case of indoor space than in outdoor green space. There wasn't any pain detected on the body part or organ in each case. Regarding the performance and achievement of the task, it was observed that a little more has been achieved during the activities carried out between the outdoor green space break than those carried out between indoor space breaks.

The above findings are in tandem with the findings of researchers such as Ulrich (1984) who found that patients with a view of nature from their hospital window had shorter hospital stays and took fewer painkillers compared to those with a view of a brick wall. Pretty, et al (2005), Van den Berg, et al (2010), and Cao, et al (2019) also provide evidence of the positive impact of green spaces on mental and physical health outcomes, this includes fewer symptoms of depression and anxiety, reduced stress, improved mood, and increased levels of physical activity which subsequently reduced risk of obesity in children.

Characteristics of the break spaces of student A

The break space in which the outdoor break is taken is in the form of a campus garden with green grass and some shrubs that provide a good view of nature (see Figure 1). The space's temperature is generally moderate, with natural type lighting, ventilation, and green color (vegetation) + blue color (sky). There are many people in the space during the break with intermittent noise coming from insects and birds throughout. While the indoor space is a dormitory common room meant for student relaxation, with about 1 to 4 people during the breaks, the temperature is also moderate, the space does not allow visual contact with nature,

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

and the source of light and ventilation is purely mechanical/ artificial. Although there exist multiple colors in the space, the dominant ones are white, red, and light green colors (see Figures 2 and 3).

Figure 1. The green campus garden at Ozyegin University, Istanbul, Turkey, taken by Darma A.U.

Student B

Student B, on the 20th and 21st of April 2023, embarked on a quest to find the perfect tranquil spot in a nearby park to spend her break time. The weather during these two days oscillated between sunshine and occasional clouds, creating a soothing and pleasant atmosphere. She

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

aimed to immerse herself in nature, enjoying the beauty of trees and flowers and listening to the melodic sounds of chirping birds and rustling leaves.

Equipped with a thermos of freshly brewed coffee and a delectable slice of cake, Student B set out to explore the park. As she strolled along the winding pathways, she couldn't help but be captivated by the scenic views that unfolded before her. The vibrant colors of blossoming flowers caught her eye, filling the air with their delicate fragrance.

Finding a serene spot beneath the shade of a majestic oak tree, she settled on a comfortable blanket spread over the grass. She had a panoramic view of the park's beauty from this vantage point.

She sipped her steaming coffee and enjoyed the symphony of nature's sounds. The sweet melodies of birdsong echoed through the air, creating a harmonious backdrop for her peaceful interlude. She was entranced by the rhythmic rustling of leaves as a gentle breeze caressed the surrounding trees.

She observed a few families scattered across the park, enjoying their time together. She watched children gleefully playing and parents engaging in cheerful conversations.

The combination of nature's wonders, the temperate weather, and the company of happy families provided the perfect backdrop for her much-needed break. She savored each moment, sipping her coffee and relishing the delightful flavors of her cake.

These two days in the park allowed her to connect with the tranquility of nature, recharge her energy, and find inspiration amidst the serene surroundings. With a sense of contentment, she returned to her academic pursuit.

Figure 4. Student B, outdoor break time, Ata Park, Miandoab, Iran, taken by Arshadi, M.

September 14-15, 2023, Naples, Italy

Figure 5. Outdoor break time picture at the Ata Park, Miandoab, Iran, taken by Arshadi, M.

Figure 6. student B outdoor break time picture, Ata Park, Miandoab, Iran, taken by Arshadi, M.

Over the two days (23 & 29 April 2023) of experimental studying and having break time inside of the home, student B studied her lessons in her room as seen in (Figure 7). There aren't any windows or natural greenery inside, just like the previous days, with the difference that she spent her rest time in the house (Figure 8). She drank the coffee in the kitchen or living room and conversed with her family members or the guest who had come. Then She returned to her routine of studying in her room

The home environment is pleasant, adorned with flowers and greenery, giving a sense of green space. It also has natural and artificial light in the kitchen and living room.

As mentioned in previous paragraphs, student B has a single study place during her study sessions (Figure 7). Unfortunately, there is no window in her study room to see natural light outside. However, the room is adorned with decorative items such as paintings, dolls, and statues, which create a visually appealing environment.

Student B has a preference for having the best view in each place she occupies. Whether indoors or outdoors, she tries to engage with nature. During her outdoor break time, she seeks out a suitable and comfortable spot in order to have a more enjoyable experience. The outdoor break places depicted in Figures 4, 5, and 6 show a park filled with flowers, trees, and green spaces,

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

alongside Zarine Rood, creating a soothing atmosphere. Student B finds these outdoor spaces more rejuvenating during her breaks.

In contrast, the indoor break time takes place in a kitchen and living room decorated with artificial flowers and greenery (Figure 8). Although she has more time for breaks inside the house, student B finds that going to the park and taking a break there is more beneficial, as indicated by her notes after each break. The park's natural setting with flowers, trees, and green spaces provides a more refreshing experience for her.

To summarize, while the indoor break area is designed with artificial greenery, the outdoor park with its natural elements offers a more fruitful break experience for student B.

Figure 7. Student B study place, room. Miandoab/ Iran, taken by Arshadi, M.

Figure 8. Student B Break place, kitchen and living room. Miandoab/ Iran, taken by Arshadi, M.

The analysis conducted by the student after completing each study or rest period was generally done using smart devices such as a blood pressure monitor or an oximeter. The counting of breaths was performed by the person accompanying the student.

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

The collected data during the experiment on student B generally indicate a positive change in the status of autonomic nervous system parameters during rest compared to study time. The examined parameters include respiration (both type and rate), heart rate (pulse), pain in a specific body part, neck/shoulder tension, and performance/progress in study tasks between rests. The data have shown that the type of respiration in both conditions (outdoor green spaces and indoor built environments) is relatively similar, characterized by diaphragmatic breathing. However, the average measured respiration rate one minute after rest is lower than the respiration rate measured one minute after studying. The average respiration rate in outdoor green spaces is 15.53 breaths per minute, while in indoor built environments, it is 16.09 breaths per minute. The average heart rate in outdoor green spaces is 86.433 beats per minute, while in indoor environments, it is 86.83 beats per minute.

Based on the obtained average statistics, higher levels of stress, tension, and pain in the neck and shoulder have been observed in indoor built environments (1.93) compared to outdoor green spaces (1.59). In terms of performance and achievement, it was observed that during the activities conducted between rests, better performance was obtained in outdoor green spaces compared to activities conducted between rests in indoor environments

Table 1. The average rates for the outdoor and indoor experiences, prepared by the authors

	Heart (Pulse) Rate / min.	Respiratory Rate / min.
Average outdoor experiences:	86.433	15.53
Average in-door experiences:	86.83	16.09

Green outdoor spaces provide a direct connection to nature, offering individuals a chance to immerse themselves in a natural environment. On the other hand, indoor spaces refer to enclosed environments like rooms or buildings, which may lack direct contact with nature. During break time, both green outdoor spaces and indoor spaces can have an impact on the autonomic nervous system, but the specific effects may vary. Pomodoro Technik helps people recharge, reduce their stress, and to increase their potential during study time.

A comparison of both break time spaces (indoor or outdoor), has found that outdoor spaces have a more positive impact on the body, pain, heart rate, and respiratory rate. Likewise, indoor artificial plants help students mentally to back to work. Thus, in both breaks time, Students' willingness to back to their work tasks increased.

Besides, home spaces can design and decorate with clever ideas based on their personalities. For instance, decorating Artificial plants like a bar cart or using Tropical houseplants can magically soften edgy décor and increase the willingness of individuals to go back to work tasks.

Student C

The data collected during the experiment on student 'C' revealed interesting insights regarding the impact of different environments on the autonomic nervous system parameters. Specifically, the study examined respiratory rate, heart rate (pulse), pain detection on specific body parts or organs, the tension on the neck and shoulders, and performance/achievement in study tasks during breaks.

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

The results indicated that regardless of the environment (green outdoor spaces or indoor built-up spaces), the type of breath remained consistent, with diaphragmatic breathing being observed. However, there were slight variations in the respiratory rate, averaging 19.64 breaths per minute in the outdoor green space and 20 breaths per minute in the indoor space. Similarly, the average heart rate was slightly lower in the green outdoor space breaks (64.2 beats per minute) compared to the indoor space breaks (65.4 beats per minute).

Interestingly, higher levels of stress and tension were recorded in the neck and shoulder areas in the indoor space compared to the outdoor green space. No pain was detected in any specific body parts or organs in either environment.

In terms of performance and achievement in study tasks, it was observed that students achieved slightly better results like reading more and succeeding more percentage of the expected workload during the activities conducted between the outdoor green space breaks compared to those between indoor space breaks.

The data collected from student 'C' provides more detailed insights into the effects of different environments on various parameters. Here are the specific findings:

Based on the student c data, the average pulse rates during the study and break times in both the exterior (green outdoor) and interior (indoor built-up) environments are as follows:

Study Time Pulse Average (Exterior): The average pulse rate during study sessions in the exterior environment is 97.6875 beats per minute.

Break Time Pulse Average (Exterior): The average pulse rate during break periods in the exterior environment is 86.85714286 beats per minute.

Study Time Pulse Average (Interior): The average pulse rate during study sessions in the interior environment is 93.125 beats per minute.

Break Time Pulse Average (Interior): The average pulse rate during break periods in the interior environment is 90.14285714 beats per minute.

These pulse rate averages provide insights into the physiological response of student 'C' in different environments. It indicates that during study sessions, the pulse rate tends to be slightly higher in the exterior environment compared to the interior environment. However, during break periods, the pulse rate is slightly lower in the exterior environment compared to the interior environment. These findings suggest that the environment may have a subtle influence on the student's physiological arousal and response.

Diaphragmatic breathing was consistently observed in both the green outdoor and indoor built-up spaces. The average respiratory rate was slightly higher in the green outdoor space, measuring 16.7 breaths per minute, compared to 14.66666667 breaths per minute in the indoor space. This indicates a slightly slower breathing rate in the indoor environment. No specific pain was detected in any body parts or organs in either the green outdoor or indoor space. This indicates that the student did not experience any pain during the experiment.

Higher levels of stress and tension were recorded in the neck and shoulder muscles in the indoor built-up space compared to the outdoor green space. This suggests that the indoor environment may induce more muscular tension and stress in the neck and shoulders.

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

The student achieved slightly better results in the study tasks conducted between the outdoor green space breaks compared to those between the indoor space breaks. This indicates a potential positive impact of the outdoor environment on cognitive performance and task achievement.

Overall, the data from student 'C' suggests that exposure to green outdoor spaces during breaks may have a slightly positive influence on the pulse and performance-related parameters. These detailed findings provide a comprehensive understanding of the effects of different environments on the autonomic nervous system parameters. They highlight the subtle differences in respiratory and heart rates, the impact on muscular tension, and the potential influence on cognitive performance. The absence of pain detection in both environments suggests a lack of discomfort during the experiment. These findings further support the notion that exposure to green outdoor spaces may have positive effects, but not with a certainty that includes respiratory rate changes. The respiratory change is different than the other participants and can be related to the heart arrhythmia that the student has or it may be caused by the stairs used to go outside the break area and come back to the indoor study place.

4. DISCUSSION

The data collected from three different students (A, B, and C) provide valuable insights into the impact of different environments on the autonomic nervous system parameters, including respiratory rate, heart rate (pulse), pain detection, the tension in the neck and shoulders, and performance/achievement in study tasks during breaks.

Student A's data revealed a slight positive change in the autonomic nervous system parameters during breaks taken in green outdoor spaces compared to indoor built-up spaces. The average respiratory rate and heart rate were slightly lower in the green outdoor space, indicating a potential relaxation response. Additionally, higher levels of stress and tension were observed in the neck and shoulder area in the indoor space. Student A also achieved slightly better performance and task accomplishment during activities conducted between outdoor breaks. These findings align with previous research indicating the positive impact of green spaces on mental and physical health outcomes.

Student B's experience in an outdoor park during breaks showed a connection with the tranquility of nature, providing a soothing atmosphere. The data collected from Student B indicated a positive change in autonomic nervous system parameters during breaks, with lower respiratory and heart rates in the outdoor green space compared to indoor spaces. Student B also reported a more rejuvenating experience during outdoor breaks, enjoying the beauty of nature, the sounds of birdsong, and the vibrant colors of flowers. This aligns with the findings of previous research highlighting the benefits of connecting with nature for relaxation and well-being.

Student C's data provided detailed insights into the impact of different environments on autonomic nervous system parameters. The results showed slightly higher pulse rates during study sessions in the green outdoor space compared to the indoor built-up space, suggesting a potential physiological arousal. However, during break periods, the pulse rate was slightly lower in the green outdoor space. The respiratory rate was slightly slower in the indoor environment, indicating a potential relaxation response. Higher levels of stress and tension were

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

observed in the neck and shoulder area in the indoor space compared to the outdoor space. Student C achieved slightly better performance during activities conducted between outdoor breaks, suggesting a positive impact on cognitive performance.

The data from all three students suggest that exposure to green outdoor spaces during breaks may have a positive influence on autonomic nervous system parameters and cognitive performance. The findings align with previous research demonstrating the benefits of green spaces on mental and physical health outcomes, including reduced stress, improved mood, and increased levels of physical activity. However, it is important to note that individual experiences and responses to different environments may vary.

The characteristics of the break spaces varied among the students. Student A had access to a green campus garden during outdoor breaks, providing a view of nature with moderate temperature and natural lighting. In contrast, the indoor space was a dormitory common room without direct visual contact with nature, with artificial lighting and ventilation. Student B chose a nearby park with trees, flowers, and green spaces for outdoor breaks, experiencing the beauty and tranquility of nature. The indoor space was decorated with artificial greenery, creating a visually appealing environment. Student C had an interior break space in the bedroom and an exterior break space in a park, both in different locations. The interior space had artificial lighting, while the exterior space provided a natural environment with trees and greenery.

In conclusion, the analysis of the data collected from three different students suggests that green outdoor spaces have a positive impact on autonomic nervous system parameters and cognitive performance during breaks. These findings are consistent with previous research highlighting the benefits of connecting with nature for relaxation, stress reduction, and improved well-being. However, individual preferences and responses to different environments may vary. Creating break spaces that provide access to nature and incorporating elements of greenery, natural lighting, and ventilation in indoor environments may contribute to a more rejuvenating break experience and enhance overall well-being.

Limitations

Throughout the study, the research team made efforts to ensure the smooth execution of the research protocol. Minor changes, if necessary, were implemented to address unforeseen circumstances or participant feedback. These changes were recorded and considered in the final analysis to ensure the integrity and validity of the study findings.

5. CONCLUSION and FUTURE DIRECTIONS

Green outdoor spaces, such as parks, gardens, or campuses, provide a direct connection to nature, while indoor spaces refer to enclosed environments like rooms or buildings. Both green outdoor spaces and indoor spaces can have an impact on the autonomic nervous system during break time. However, the specific effects may differ. The existence of green space during break time in a Pomodoro study pattern can have several positive impacts on individuals. It can promote relaxation, stress reduction, and restoration of cognitive resources. During the Pomodoro experiments, alternating between natural (outdoor) and built (indoor) environments during breaks can potentially impact stress levels and overall working progress. Natural environments may enhance relaxation and recovery, while built environments may offer a controlled and focused setting for studying. Studying in the same place but taking breaks in a natural environment can have a different impact on the body's response compared to spending

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

break time in a room. Natural environments may provide a sense of rejuvenation, increased attention restoration, and reduced mental fatigue. To enhance the quality of spaces for studying in green environments, it is essential to consider the balance between relaxation and study periods. Providing comfortable seating, access to natural elements, adequate shade, and minimal distractions can optimize the benefits of green spaces for both relaxation and focused study. Green and open spaces can have a similar effect on the recovery of the mind and body compared to home spaces. However, the specific results may vary depending on individual preferences, the design of the home environment, and the extent to which the home provides a sense of calm and relaxation. In summary, green outdoor spaces can have a positive impact on the autonomic nervous system during break time in a Pomodoro study pattern. Exposure to natural environments during breaks may contribute to stress reduction, relaxation, improved attention restoration, and overall well-being. Designing and utilizing green spaces effectively can enhance the quality of study environments and promote optimal balance between relaxation and focused work.

Email: sezenbe@itu.edu.tr

ABSTRACT

Archaeological museums serve as apparatus that visualize the past by transferring knowledge into specific spatial arrangements. Examining the practices of museumization in history, a representative model became an apparatus for the Enlightenment ideology; however, it underwent typological transformations in the twentieth century, particularly within the debates on post-colonial 'new museum theory,' leading to epistemological questioning. In this process, architectural articulation emerged as a crucial aspect of museum design, particularly from the 1960s onwards. For approximately thirty years, archaeological museums, especially the ones designed in Europe, have been established in or around archaeological sites. They either have a visual connection or direct contact with the ruins and demonstrate architectural inventions related to the site's context. From this perspective, the museum turns into an optical apparatus that reconstructs the past through gazing. This research focuses on architectural devices in archeological museums, specifically analyzing Turkey's Troy and Greece's Acropolis Museum. The study critically examines the role of architectural design in shaping these two museums within the current context. By exploring how these new architectural fictions and tactics help to represent the past, the study aims to offer insights into the contemporary position of archeological museum design.

Keywords: Archaeological Museum Design, Archaeological Site Museum, Visual Device, Past, Representation.

1. INTRODUCTION

The archaeological museum mediates between us and the past. Despite the fragmentation and incompleteness of the archaeological materials, it constructs a narrative out of them. The museum is a medium where this narrative is visualized and presented to visitors. Archaeology, on the other hand, translates its investigations and interpretations into writing. In this regard, Greek archaeologist Hamilakis (2020) distinguishes the knowledge produced by archaeology from the intrinsic entity of material remains. Both practices construct their objects with their respective tools and methodologies. However, as Czech philosopher Flusser (1990) pointed out, mediation is inherently distorting. All representations created by humans to understand and explain nature ultimately deviate from their original purpose and produce unintended meanings. Therefore, it seems crucial to explore the mediation of museums in our ways of understanding and representing the past.

The research focuses on the role of architectural design rather than display and curatorial policies of museums, as architecture has become one of the prevailing inputs in museum design, influenced by modernism throughout the twentieth century. Particularly in the 1960s, epistemological shifts gave way to critical inquiries under the 'new museum theory' (Marstine, 2006) on the colonial history of museums. As a result of this critical discourse, the universal

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

museum model gave place to innovative attitudes of museums like the Moma, the Guggenheim Museum and the Pompidou Center (Hoffmann, 2016). Besides, in the case of archaeological museums, various new museum practices have emerged in response to the development of national archaeology and necessitate their architectural models.

However, starting from the late twentieth century in Western geography, one of the most significant developments specific to archaeological museums is their aim to engage with archaeological sites. Within the scope of this study, archaeological museums designed in Europe from the 2000s onwards, along with mixed-collection museums with archaeological collections, have been examined, and a total of fifty-nine museums from various countries were evaluated. An important finding is that fifty archaeological museums are regional or site museums. This case signifies a shift away from the universal museum practices that possessed treasures from all corners of the world, replacing them with local museums. Another finding is the increase in on-site exhibitions. By this, eighteen museums have been built upon archaeological remains. However, concerning the twentieth century, out of sixty-one museums considered, only two engaged in in-situ exhibitions.

The archaeological site museums in question construct the narrative of the past in various contexts. These contexts may be geographical, topographical, or even a single archaeological fragment. However, their common feature is the inclusion of archaeological remains within the field of vision. Among these, the Troy Museum from Turkey and the Acropolis Museum from Greece are prominent examples of archaeological museums designed in the 2000s. They have significant achievements in terms of their visual qualities. The Troy Museum addresses the ancient city of Troy within the Troas region. It inclines to establish a connection with the geography. The Acropolis Museum, on the other hand, has taken a close-up approach to the Athens Acropolis and particularly the most significant structure within the Acropolis, the Parthenon temple. Despite engaging with the past in different contexts and through various instruments, both museums question the traditional visions of museums. In this article, the architectural designs of the Troy and Acropolis Archaeological Museums are discussed within the context of the visual device metaphor, thus evaluating the potential of architectural design in terms of representation of the past.

2. MATERIALS and METHODS

Establishing a relation between the archetype of the museum and the *camera obscura*, which is an integral element of the same epistemological paradigm, is seminal to exploring the distinctive qualities of contemporary museums that differentiate them from the typology of Enlightenment museums. Importantly, these connections are entirely conceptual, avoiding the construction of a physical resemblance. Moreover, it is essential to recognize that it is impossible to examine a museum solely from the perspective of a single device. The optical devices, likewise, are complex inventions in terms of being "points of intersection where philosophical, scientific, and aesthetic discourses overlap with mechanical techniques, institutional requirements, and socioeconomic forces" (Crary, 1992).

Camera obscura, meaning "dark room," is a device that, despite being an optical technology, is often referenced for its ideological implications. In the nineteenth century, thinkers such as Marx, Bergson, and Freud regarded it as a device that conceals reality and even transforms it into an illusion. The observer's confinement within an enclosed space and the inability of the device to establish a connection with the outside world contribute to the enigmatic nature of

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

this illusion (Crary, 1992). "Thus, the *camera obscura* isolates consciousness, separates it from the real" (Kofman, 1999), and creates an impermeable boundary between the inner and outer worlds. From this perspective, it is possible to interpret the device as a reflection of the first museum model.

The interest in antiquity as a phenomenon and the fascination with it began with the Renaissance. The concept of the exhibition first emerged as the arrangement of notable items, known as the "cabinet of curiosities," based on the personal interests of monarchs and princes in their highly private chambers (Artun, 2018). With time, as princes started to open their collections to a specific community gradually, they evolved into galleries. However, the development of museums as a specialized field intertwined with Enlightenment ideology. The random exhibitions in princely chambers began to be categorized and systematized during this period. The design of museum spaces also reflected these differences. The plan proposed by Jean-Nicolas-Louis Durand in the late 18th century, which served as the basis for the following museums, is based on a schema where different selections are presented together (Pevsner, 1997). The neoclassical museums of the 19th century offered visitors a divine spectacle by isolating them ideologically and physically from the external world. Indeed, the perception of being enveloped in an inner space is quite strong in these museums. Features such as stone walls and partial openings of the structure performing for light sources rather than visual contact enhance the idea of an isolated inner world. Carol Duncan (2006) argues that the archetypical form of the museum reminds of pre-modern temples. For example, a grand colonnaded entrance and staircase prepare the visitor for a divine journey. Monumental gateways adorned with impressive sculptures maintain the idea of a sacred place inside the museum. In the exhibition, spatial arrangements specifically demand the museum visitors' attention. The most exclusive pieces of the collection are displayed prominently, often in the most exceptional location within the museum. For instance, one of the most important exhibits in the Berlin Neues Museum, completed in 1955, is the bust of Nefertiti. The bust is displayed alone in the center of the northern rotunda, illuminated by natural light from above.

In a Marxist sense, the allusion of such a type of exhibition arises precisely from the exclusion of the physical conditions under which these objects were produced. In other words, artifacts of the Enlightenment museums were transported from the cities where they originated to Western cities, often thousands of kilometers away. Consequently, universal museums eliminate the context of archaeological sites. However, site museums can maintain the connection between archaeological fragments and the site. In contrast to many site museums that do not take advantage of this possibility, recent museums like the Troy and Acropolis Museums stand out for their efforts to establish this connection. The research focuses on understanding how these two museums have developed optical mechanisms.

3. FINDINGS and DISCUSSION

The Troy Museum, established in the context of the ancient city of Troy, was relocated with the transfer of the Çanakkale Regional Museum. It is situated approximately 800 meters away from the archaeological site, built within a landscape surrounded by cultivated fields. From a distance, the structure looks like an obscure box with very few facade openings, making it unclear whether one can enter it. This box evokes the concept of a dark chamber, reminiscent of *camera obscura* (Figure 1). As one approaches the building, a ramp descends downwards as an extension of the topography, providing access to the interior. Nevertheless, even now, there

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

is no indication of what occurs inside. The entrance floor is below the ground level. As we enter, the outer façade is revealed again through the glass roof of this floor (Figure 2). Up to this point, the museum is an apparatus that displays its exterior rather than its interior.

Figure 1. The Troy Museum

Figure 2. The glass roof and the view of the facade on the ground floor

The opaque mass seen from the outside comprises gallery floors and a circulation ramp that connects these floors. Inside the volume, the galleries are arranged in succession, resembling the layers of Troy. The collections are exhibited thematically on each floor, and the objects are freely displayed in the central area. The ramp traces a circular path between the façade and the floors (Figure 3). As we move through the ramp, the view of the geography upon which the museum and the ancient city were once built is revealed from the partial openings in the façade. Along with the circulation, the perception of the building's opacity begins to break, and the present-day view of the landscape starts to unfold (Figure 4). As a result, the archaeological fragments and the images of the site the fragments were excavated from come in sequences as in a cinematic montage.

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

Figure 3. Circulation ramp

Figure 4. Troas view from the openings on the facade

The circulation space defines a void within the building, temporarily suspending the exhibition and allowing the exterior world to infiltrate the museum. The spatial void turns into a mnemonic void, recalling the fragments of the museum's narrative. Thus, the museum's two architectural elements - the facade and the ramp- compose a montage apparatus that operates as a tool for imagining the past along with the present. As two temporalities - the past and the present - and two spaces - the interior and the exterior - intersect, our sight also splits between them, losing its central position.

The ramp finalizes its route at the top of the building, which is a periscopic terrace, allowing one to observe Troy's ancient foundations from all perspectives. Here, we find nothing but the bare view of the landscape. Observers are left face-to-face with the emptiness of the site to reconstruct the past in their memories.

On the other hand, the new Acropolis Museum is the outcome of the fourth attempt at an architectural competition organized to meet the need for a new museum due to the insufficiency of the old museum within the Acropolis for new findings (Pandermalis, 2017). Compared to the geographical context of Troy, here, we find an approach that focuses directly on the Acropolis itself. While the Acropolis of Athens continues to stand as a landmark in the dense

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

urban fabric of modern Athens, the museum positions itself within this urban context, facing the Acropolis from 300 meters. In contrast to the exterior of the Troy Museum, it is transparent due to its extensive glass surfaces. Furthermore, it presents a more dynamic and interactive impression with different geometries, materials, and mass openings (Figure 5).

Figure 5. The Acropolis Museum

Similarly, the exhibition areas arranged within the museum have different characteristics, supported by spatial differences such as size, height, and geometry, corresponding to the thematic variations of the displayed fragments. Just before entering the building, ancient artifacts beneath the ground are visible through a gap in the floor. The structure rises on pilotis like a protective cover over the ruins. The findings along the path leading to the rock are displayed on the ground floor. Although located on the same level, the two galleries on the first floor are separated by an intentionally created void within the building. Without dividing walls, these open-plan galleries host fragments related to Athens' archaic and Roman history. The gallery on the top floor is entirely dedicated to the frieze and pediment sculptures of the Parthenon temple. The circulation scenario of the museum is designed not according to the sequential order of the floors but based on the exhibition themes. Vertical circulation elements are placed at both ends of the building so that visitors can move throughout the length of the museum and follow a new route on their way back. The museum views modern Athens from all its facades while it gazes at the archaeological site above the rock from the north facade. In this regard, the museum resembles an observatory where we can observe the Acropolis directly; it directs its telescope toward the sky, watching the archaeological fragments standing 150 meters above the ground. However, this telescopic mechanism enables the ability to see the Acropolis without any obstruction and the installation in the Parthenon gallery (Figure 6).

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

Figure 6. The view of the Acropolis through The Parthenon Gallery

The Parthenon temple is the symbol of the Acropolis and Athens. The Parthenon gallery, as if confirming this, is the most important fragment of the museum. Designed as a glass box, this structural part of the building is deliberately shifted from the axis to become parallel to the temple. The unique construction designed to exhibit the frieze and metopes of the Parthenon resembles the temple's cella itself. Moreover, marble sculptures are placed according to their original positions. Even the sculptures on the pediment are displayed on the ground in their original orientations (Figure 7). The Parthenon gallery allows visitors to see the constructed fragments and the temple together. Metaphorically speaking, the glass panel of the gallery acts as a telescopic lens, magnifying the image of the source object and displaying it in the gallery. Thus, the friezes brought to eye level can be examined in detail. By overlapping the external image of the Parthenon with the representational one inside, the missing fragments are embedded in their original places fictionally. Thus, the museum begins to function as a representation apparatus where the image of the past is reconstructed within the present moment. The gallery is a well-lit room that engages with external reality rather than eliminating it.

4. CONCLUSION and RECOMMENDATIONS

Archaeological museums, which have freed themselves from the conventional spatial and narrative models throughout the twentieth century, today mediate between the archaeological past and us primarily through architecture. This mediation also places architectural design in an essential position in representing the past, as much as curatorial preferences. Architecture plays various roles in this process. For example, the Troy Museum design aims to engage with geography. In contrast, the Acropolis Museum aims for a more direct relationship with the archaeological site by focusing on a fragment of the Athens Acropolis, the Parthenon Temple. Although constructed in different contexts, both museums invite the exterior world inside rather than creating an enclosed indoor space. The Troy Museum transforms into a montage apparatus, allowing us to construct the past by juxtaposing images of exhibited archaeological objects with the present-day views of the landscape from which these artifacts were excavated. The Acropolis Museum, on the other hand, serves as a telescopic device that allows us to observe the Parthenon in its original location while magnifying its details for us. As a result, in both museums, the gaze constantly shifts between times and spaces, disrupting the consistency of representation.

ABSTRACT

Housing has been a shelter for people left unprotected in nature and a problem that has been sought to be solved in architecture from past to present. In this study, houses in different natural environments were examined in terms of ecological and sustainability principles. It is especially important to examine rural houses, which exist in rural settlements where natural life principles are seen more than in cities and are considered as local/traditional architectural products. On the other hand, Sustainable Architecture is one of the current issues of architecture and directly affects global policy making. Within the scope of this study, rural housing patterns were examined in terms of sustainability. The study is limited to rural settlement patterns covering 10 different villages in Başkale district of Van province, located in the east of our country.

Keywords: Vernacular Architecture, Sustainable Architecture, Başkale Rural Housing.

1. INTRODUCTION

One of the most important problems since the beginning of human history has been housing, and housing production has been undertaken to solve this problem. With the development of technology and the differentiation of needs, more planned and functional structures were produced, thus the concept of architecture was formed. The pandemics and then the earthquakes that have occurred in the last few years have provided opportunities to rethink cities and especially the residences we live in and to critically examine the existing ones. Although difficult, this process has shown that there is no solution other than building ecological and sustainable buildings and residences in nature, in harmony with nature and belonging to the place.

Rural houses have ecological values due to their natural harmony with their environment are closely related. As a matter of fact, the concept of ecological structure is intertwined with nature and does not depend on production. that does not harm the nature and is self-sufficient in terms of energy efficiency It includes structures. Therefore, rural houses have a significant impact on ecology with their prominent features. They adapt more to structures (Zorlu and Faiz, 2012).

Architecture that is compatible with ecological values also includes the concept of sustainability contains. Sustainability, especially in the new world where consumption increases. As the destruction of the environment, which is the main problem of society, becomes visible, came to the fore together. Thus, sustainability can be defined as the continuation of the use of natural resources and also allowing the use of these resources in the future (Serin, 2011). In addition, sustainability has a wide scope that includes many different branches. In this respect, sustainability principles that include environmental, social and economic elements, It also directs the discipline of architecture (Özer and Oral, 2017).

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

In the ecological architecture approach, the basic principles are to examine the environment and climatic values in which the building will be located. The role of buildings in uncontrolled energy consumption, which is shown to cause threats up to global climate changes in the world, is quite high (Gökşen, Güner and Koçhan, 2017). Thus, ecological architecture includes, on the one hand, benefiting from environmental data and renewable energy resources, and on the other hand, reducing the impact of the building on the ecological system, planning the construction-use-maintenance-demolition phases of the building, effective use of energy, materials and water, and ensuring people's mental and physical comfort conditions (Serin, 2011).

Although the concept of sustainability has become widespread today as a new concept, it is possible to find its foundations in the past. In this context, when traditional architectural structures are consciously analyzed, it can be seen that sustainable and ecological values were considered long ago. Based on this idea, some scientists argue that the foundations of sustainability lie in the past. They even state that ecological criteria can still be followed and benefited from in rural areas of third world countries (Özer and Oral, 2017). Based on these thoughts, it is an important issue to consider traditional architectural structures within the framework of ecological criteria. It is especially important to examine rural houses, which exist in rural settlements where the principles of natural life are more prevalent than in cities, and are considered as local/traditional architectural products. Considering that these experiences are in danger of extinction as a result of the abandonment of local techniques and materials today, the cultural heritage in rural areas needs to be documented. In this way, it will be possible to play a guiding role in the structures to be built in the future. Therefore, it is necessary to investigate in detail the answer to the question of what kind of houses are unique to the geography, topography, climate and region where they are located and compatible with nature, and how solutions are made in nature. Research conducted in this context has revealed the importance of focusing on traditional and local identities and traditional housing patterns and examining these textures, especially in terms of sustainability and ecological aspects. Van Başkale Rural Houses, which are discussed within the scope of the study, are shaped according to the characteristics of the geography in which they are located and are thought to be remarkable in terms of ecological values.

Information About Başkale

Başkale district, located on the Van-Hakkari road, is 20 km from the Iranian border and the Van city center. It is 112 km away. The district is located in the upper basin of the Zap River, near the İspiriz (Başkale) mountain. It is located in the foothills. On the northern border of the district is Saray, a district of Van; in the east, the Turkish-Iranian border; in the south, Yüksekova, a district of Hakkari and in the west, a district of Gürpınar, a district of Van (Figure 1). The district, which has a very mountainous and rugged geography, consists of a valley surrounded by high mountain ranges extending in the north-south direction. Its surface area is 2599 km and its altitude is 2460 m above sea level. The average number of snow-covered days is 140 days (Kılıç, 2006:31).

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 1. Başkale Map (URL-1)

History

It is seen that Başkale was a border region between the Parthians and the Romans in the past. The region later came under the rule of the Sassanids in the 3rd century, and in the 6th century it came under the rule of the Byzantines. After remaining under the rule of local Armenian lords after 645, the district was taken over by the Ahlat Shahs, who were established in the 12th century. However, the region, which was attacked by the Mongols in the 13th century, remained under the rule of local lords for a while. This situation lasted a short time and the region came under the rule of Timur and then the Karakoyunlu. It came under the rule of the Safavids in the early 16th century. The region was annexed to the Ottoman Empire in the mid-16th century. The district, previously known as Kotur-Elbak, was known as the Elbak district of the Hakkari sanjak of the Van province in the late 19th century (Figure 2). (Kılıç, 2006:31).

Figure 2. A photograph from Başkale District Center, thought to date back to the 1900s (URL 2)

Socio-Cultural Life and Economy

The daily life of the people in Başkale rural area is shaped around their livelihood and cultural activities. People are busy with work such as grazing animals and mowing grass in the summer, and in the winter months, if it snows, they are busy with cleaning the roof and taking care of the animals.

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

Unlike many other rural settlements, in Başkale, men rather than women are seen to work more actively in jobs such as animal care. Herbed cheese, which is produced abundantly in the region with the milk obtained from animals, is also widely made in Başkale. The tandoor, which used to be lit every day to meet the bread needs of the household, is now burned once a month.

The main source of income of the people in Başkale district is animal husbandry. Raising small livestock, especially sheep, is common. Milk, cheese and yoghurt are produced from animal products, and these products are mostly used for the daily needs of the household. Although agriculture is not very developed in the district due to harsh climatic conditions and scarcity of plant production areas, wheat, barley and potatoes are the main products grown. The district is adjacent to Iran, but since there is no border gate, border trade cannot take place.

Some families, depending on their economic sufficiency, have a house where they stay in Başkale district center or Van center. These families stay in the town or city in winter and in the village in summer. Transhumance activities, which have an important place in the culture of the region, continue, albeit to a lesser extent. It is observed that some of them had to leave the villages completely due to reasons such as village evacuations and worsening economic conditions, and as a result, houses with locked doors became increasingly unusable.

Important Natural And Historical Values In Başkale

There are buildings of historical architectural value in Başkale, which has been a residential area since ancient times. In addition, it is a settlement with natural beauties. Ispiriz Mountain, located within the district borders, is an important natural area with its rich flora and fauna. Kelegom, a hot water source 6 km away from Başkale (Figure 3), the edge of Batkam Creek right at the entrance of the district, and the edge of Değirmen Creek 3 km away from the district, are the main recreation and picnic areas (Kılıç, 2006).

Some unique landforms formed as a result of natural processes can be found within the district borders. In Akçalı village, there are karstic travertines with dimensions of approximately 100 x 200 m (Figure 4). In addition, the fairy chimneys in Yavuzlar village are a natural resource with high touristic value (Figure 5), and the traces of the St. Bartholomeus Monastery, one of the religiously important buildings, are still standing (Figure 6). (Elmacı and Sever, 2011).

2. MATERIALS and METHODS

In this study, houses in different natural environments were examined in terms of ecological and sustainability principles. The study is limited to the rural settlement patterns of Başkale district of Van province, located in the east of our country. In the on-site investigations covering 10 different villages, it was determined that they had similar settlement and structural features,

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

and that they were architectural formations compatible with nature without disturbing the topography, climate, natural resources and most importantly, nature.

3. FINDINGS and DISCUSSION

General Architectural Features Of Başkale Rural Residences

The physical environment and socio-cultural and economic factors that were effective in the formation of rural houses were also effective in the formation of Başkale rural houses. The geography of the region, consisting of mountainous and steep terrain, plays an important role in shaping the architecture. As a matter of fact, this geographical structure means that the settlements are scattered and far from each other has been effective in its development. At the same time, architectural solutions suitable for the sloping land structure have been developed (Figure 7).

Figure 7: Views from Başkale countryside

The crowded family and tribal structure of the region is also reflected in the architectural planning. However, despite this, very large sizes and complex plan types are not encountered in the formation of houses. Considering their availability as building materials in the region, the use of adobe, stone and wood is at the forefront. Construction techniques and material selections were formed under the influence of geographical and climatic conditions, as in other regions of Anatolia. In the rural houses of Başkale, adobe was mostly used as a building material on a stone foundation. However, examples of stone materials used in their walls can also be found. The houses were built with wooden beams and flat earthen roofs (Figure 8).

Figure 8: Başkale rural houses built with adobe, stone and wood materials

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

The houses were built as single and two-storey. This is shaped according to the size and economic conditions of the family. Although there are generally no garden walls, the existing ones are either made entirely of stone material or the bottom is made of stone and the upper part is made of adobe (Figure 9).

Figure 9: An example of rural housing from Başkale villages

As in other Eastern Anatolian residences, in Başkale Rural Residences, tandoor, cold it is an element that makes life easier in climatic conditions (Figure 10). Therefore, the main center of the residence It can be said that it is. In cold and long winter seasons, thanks to the tandoor, both the entire house and the household warms up by sitting around the tandoor.

Figure 10: The most important place of rural housing is the tandoor house and the tandoor

The place where animals are kept in the countryside of Başkale, where the main source of income is animal husbandry. It is seen that the barn is always included in housing planning. The barns, called gov in the region, are mostly adjacent to the house and are located at the back of the house (Figure 11). Entrances are generally thought to be a little away from the living area.

The toilet is not located inside the house, but is located outside and in a separate place, usually in an inconspicuous place. Examples of this type of toilets made with local materials and techniques in full circular form attract attention (Figure 12). Just like the kitchen and bathroom, the toilet was either added to the building later as a new space or an existing section was converted into a toilet and continues to be used.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Figure 11: An example of a barn in the countryside of Başkale

Figure 12: Circular-shaped toilet located outside, close to the house

4. Başkale Rural Residences In Terms Of Ecological Criteria Evaluation

Başkale rural residences will be discussed under the headings of topography and orientation, climate, form and plan fiction, building materials and waste management, which are considered ecological architectural criteria.

Topography and Orientation

Başkale's geographical conditions are quite rugged and challenging. The geography, consisting of mountains and large and small hills, becomes more evident in the countryside. Village settlements are generally established on the slopes of mountains or on the hills of plains. There is inevitably a natural slope of the land. However, the villages in the observed area are located on topography with wider plains rather than very steep slopes.

Houses were generally tried to be placed on flat ground. It was fed into the subgrade and a level environment was created in the house. In more sloping areas, the main production spaces of the house, such as barns and tandoori houses, were built and a method suitable for the shape of the topography was followed.

In addition, due to the earthquake effect, buildings are generally single-storey, although there are at most two-storey ones. The roofs of buildings located on sloping lands descend gradually.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Thus, there are examples where it is possible to pass from the roof of one house to another. Same in places where there are many parts buried in the ground, no stairs should be installed on the roof. It can be easily exited without using it (Figure13). The orientations are based on the rooms and rooms occupied by the very harsh climatic conditions of the region. Entrance doors are oriented towards the south or east to receive more sunlight.

Figure 13: Housing texture positioned according to topography (Upper cluster /Rêkan village)

Climate

It can be said that the planning and dimensions of Başkale rural houses are largely shaped by the climate. As a matter of fact, it is seen that the climate of the region is determined by the cold continental climate in terms of the location and dimensions of the tandoori house. Especially in the oldest housing examples that have preserved their original structure, the tandoori house is located inside, like any other room in the house, in connection with the sofa. Its dimensions are larger than other spaces and it also functions as a kitchen. There is also usually a bath stone in one corner. All areas of the house are heated by the tandoor that is frequently lit. Similarly, if the barn is adjacent to the house, the temperature of the animals can be utilized in the house as well. Depending on the topography, the majority of the buildings are tandoori houses and barns, which are partially or completely buried in the ground (Figure 14).

Figure 14: Interior view of multi-purpose tandoori house

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

When the street structure in Başkale rural settlements is examined, it is seen that the houses are generally not located very close to each other and the streets are wide. It is thought that this situation was consciously chosen so that the houses do not block each other's sun and to benefit from the heat at the maximum level. However, it is built on a ridge

There are also some examples in settlements where houses are built almost adjacent to each other in order to be less exposed to the effects of strong winds (Figure 15).

Figure 15: Wide street structure on flatter land and narrow streets on sloping land

The spaces are kept in average sizes to meet the needs of families even if they are crowded and not to increase heat loss. In addition, wall thicknesses, which are generally kept between 56-80 cm, serve as insulation between the external environment and the internal environment. exterior facades straw.

It was plastered with mixed mud plaster. Especially in the oldest houses, it is seen that transparent surfaces are used very rarely on the facades, in accordance with the climate of the region. As a matter of fact, it was determined that window and door sizes were kept at very minimal sizes (Figure 16).

Figure 16: Small sized doors and windows on the facade

Form and Plan Edition

Başkale Rural Houses were planned in an outward-looking manner, just like Van local houses (Subaşı Direk, 2009; Öztürk, 2006). The residences are closely related to nature, even integrated, and built in human dimensions. The spatial organization of the residences, which have a very simple appearance, is formed according to the cultural and economic characteristics of the users and climatic data.

Although the families are crowded, one of the striking details is that in Başkale rural houses, especially the living spaces are not built in very large sizes. Semi-open areas such as balconies

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

and terraces are almost non-existent in residences. While the entire house is covered in closed areas, open areas are also quite large due to the fact that it is a rural settlement. As a matter of fact, all places other than residential areas can be considered as natural open space. However, the use of open space varies depending on the season (Figure 17).

Figure 17: Başkale rural houses

Dwellings are generally square, rectangular or L-shaped (Figure 18). When you enter, there is a large sofa and rooms lined up around it. The tandoor is not considered independent of the house, in fact it is the main space of the house. Toilets were generally located outside, and bathrooms were located very close to the tandoor or inside the tandoor house. The barns are mostly adjacent to the house, but their entrances are planned further away from the house entrance. However, in older houses, there are also traces of doors opening from the tandoori house or the sofa to the barn.

is encountered. Thus, it can be said that connections are provided between all spaces without going outside. The number of rooms may vary depending on the size of the family and they have more than one function. The rooms, which are used for living purposes during the day, also have the function of laying down beds at night. In addition, considering tribal meetings and large families, it does not go unnoticed that some rooms are more elaborate and that there is more than one guest room in a residence.

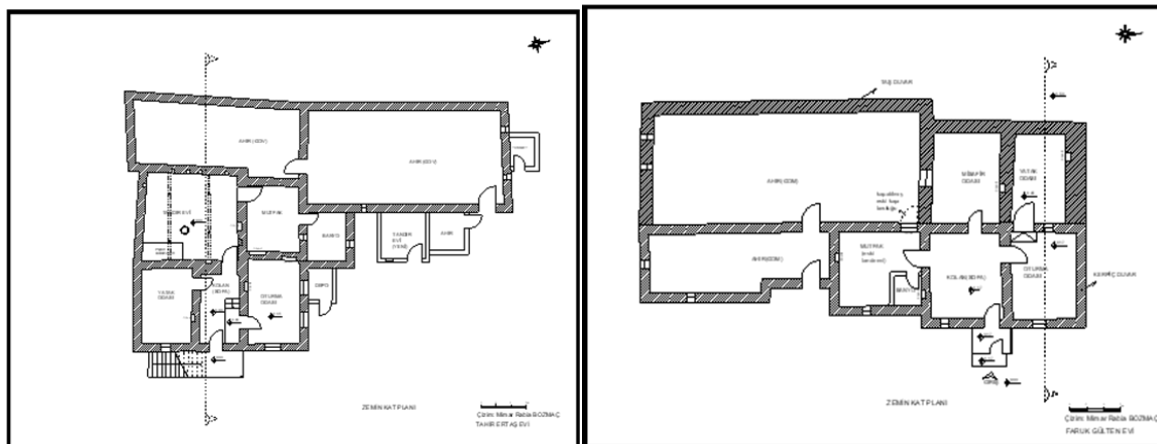

Figure 18: House plans are generally square, rectangular or L-shaped.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Building Materials

Başkale rural houses were built from building materials that were easy to obtain in the region and local construction techniques were used. Due to the selection of local materials, there is no need for extra transportation and processing. Traditional houses were shaped with the use of adobe, stone and wood, which are easy to obtain in the region. As a result of some processes of the soil, adobe, one of the building materials most compatible with human health, was obtained and used throughout the houses. The straw and other aggregates added are also in the same way. Stone material, which is generally preferred for foundations and spaces such as tandoori houses and barns, is unprocessed and is present in the structure in its natural state (Figure 19).

Figure 19: Başkale rural housing building materials

Wood is the most used building material after adobe and stone. The wood used as the carrier and covering material of the flat soil roofs of the spaces is obtained from trees such as elm and poplar found in the region. Additionally, wood was preferred for door and window joinery (Figure 20). The binding material on the walls is mud. Straw-mixed mud was used in interior and exterior wall plasters. The mud plaster was covered with lime whitewash. The floors are compressed soil and there are also houses that are covered with cement screed over time.

Figure 20. Wood is used in ceiling tiles, door and window openings

Waste Management

The materials used in Başkale rural residences are completely local and natural. In this respect, it is not possible to leave any material waste to nature during the life cycle of the buildings. Additionally, since locally available materials are used, there are no transportation costs.

Since adobe is obtained in natural and residential environments, it is not possible to use it in factories, etc. There is no need for formations that pollute nature. Since the stones used are

TeMALab
Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

generally rubble, they need to be processed for a long time. It is not the subject. Since the dirty water coming out of houses is generally conveyed to gardens or open pastures, it has gained a natural purification and functionality. The same applies to sewage waste.

4. CONCLUSION and RECOMMENDATIONS

Rural houses are architectural products without an architect and attract attention with their practical functional solutions developed according to the requirements of rural life. As a matter of fact, it is seen that the spatial organization of the houses is affected in line with the data ranging from the livelihood of the user family to the climatic conditions and cultural life of the region. In addition, rural residences that respect the natural environment and give it space are integrated with nature. Considered in this context, it is thought that rural residences will offer different perspectives to today's industrial, ready-made and consuming residential architecture, especially in the context of sustainability.

Başkale Rural Residences have a structure intertwined with nature and have unique qualities. In this respect, it can be said that they are compatible with ecological architecture. The mountainous land structure of Başkale rural settlements was effective in the formation of the plans and forms of the houses. In areas where there is a lot of slope, the buildings are built half buried in the ground and are in harmony with the topography. Construction techniques and material selections were formed under the influence of geographical conditions and climate data, as in other regions of Anatolia. The use of adobe, wood and stone as building materials in the region is at the forefront.

The building materials and rural houses do not constitute any contradiction with the structure of the nature in which they are located, and color, texture, etc. As of now, they provide this. In addition, the rate of leaving non-biodegradable waste is very low compared to today's buildings.

Today, popular building materials and construction techniques are slowly reaching rural settlements. However, abandoning local materials and techniques will have a negative impact on ecological architecture. Materials used in the same way everywhere may not adapt to the structure of the place and the user. When evaluated in this context; It is thought that it is necessary to take some precautions to protect the rural housing texture of Başkale, which is still largely standing. In addition, archiving with documents is also important for the future. Thus, it will be possible to guide new rural residences to be built.

ABSTRACT

The relationship between the physical environment and human beings has been a main subject of environmental psychology research since the 1970s, with various concepts influencing each other. This study aims to examine the literature on place attachment and its relationship to the environment and human interactions. Place attachment is a multidisciplinary concept that centers on the emotional connection between humans and space. The use of this notion has been observed in various design disciplines, including planning, architecture, and interior architecture, all of which are rooted in the fundamental concepts of human interaction, place, and space. This study analyzes existing worldwide theses pertaining to place attachment, aiming to understand the general trend, identify gaps, and discover new areas of production that will contribute to the literature. The research area is limited to the ProQuest Thesis Database. The meta-analysis method was used to analyze the data quantitatively, focusing on the intensity of thesis production in the historical process, design, and related disciplines. The most frequently used concepts related to place attachment were identified through content analysis. The research findings suggest that there has been a notable increase in the creation of theses on the topic of place attachment in the international literature. This increase is particularly evident in the fields of planning, design, and architecture. There is potential for further exploration and expansion of research subjects within attachment research pertaining to place and space, spanning many scales.

Keywords: Place Attachment, Place, Space, Scientific Research, Thesis Production.

1. INTRODUCTION

The concepts of place and space play a significant role in facilitating comprehension of place attachment. The environment in which people reside possesses various characteristics, including geographical, material, temporal, functional, and structural aspects. Additionally, it encompasses gaps and boundaries, engages multiple senses, and holds symbolic significance (Relp, 1976, 1991, 2016; Liu & Freestone, 2016; Williams & Miller, 2021). Place and space contain abstract and concrete meanings, although they are both individual and social. In addition, spatial experience creates the meaning and existence of place. At the same time, it is at the forefront of its social existence as well as its economic existence (Harvey, 1985; Tuan, 1997; Lefebvre, 2014; Cresswell, 2015; Hubbard & Kitchin, 2021).

TeMALab

University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

Human beings, by nature, have a framework that develops emotional links with their surroundings, owns them, protects them, gives them significance, and connects them. The concept of place attachment refers to the bond between people and place. Place is the physical environment with which people relate emotionally; attachment refers to the effect that occurs between a person and his environment (Low & Altman, 1992). Place attachment is directly related not only to people but also to the society and culture in which people live. The values of the society in which the individual lives and the meanings of the place effect the formation of place attachment (Riley, 1992). Place attachment turns into action as a sense of responsibility that a person feels towards the places or places to which they are attached. This concept, which develops in direct connection with the social structure, emerges with a collective movement in cities (Manzo & Perkins, 2006). Low and Altman (1992), who conducted important research on the concept of place attachment, discussed the concept in the following five categories:

- *Attachments (affect, cognition, and practice)*
- *Places that vary in scale, specificity, and tangibility*
- *Different actors (individuals, groups, and cultures)*
- *Different social relationships (individuals, groups, and cultures)*
- *Temporal aspects (linear, cyclical).*

There are many studies from different disciplines in the literature on place attachment (e.g., Skotols & Shumaker, 1982; Relp, 1976; Riley, 1992; Giuliani, 1991). It is seen that each of these studies was influenced by each other and developed the concept of place attachment, but still no common conclusion could be reached. Scannell & Gifford (2010) paved the way for agreement in the literature with the "place attachment theory" in their study. Place attachment theory consists of three dimensions: person, process, and place. A person includes individual and social meanings. The process examines the emotional, cognitive, and behavioural components of place attachment. Place questions the relationship between the nature of place and attachment by considering the physical and social environment (Scannell & Gifford, 2010).

It is thought that it is important to observe the development of the concept of place attachment in design disciplines in order to understand the relationship of the individual and society with the physical environment. With this in mind, this study aims to understand in which design disciplines the thesis productions on place attachment research have been carried out from the past to the present.

2. MATERIALS and METHODS

This study examines existing international thesis productions on the concept of "place attachment". The aim of the study is to understand the general approach found in the literature, to identify its positive and negative aspects, and to discover new study topics that can contribute to the literature on place attachment. The research area is limited to "The ProQuest Thesis Database". Thesis studies that are not included in ProQuest but are in the universities' own databases are excluded from the scope of the research.

The research was carried out using the meta-analysis method. Research data were analysed quantitatively according to the density of thesis production in design and related disciplines and the density of thesis production in the historical process. However, the most frequently used concepts related to place attachment were identified by content analysis.

III. International Architectural Sciences and Applications Symposium
September 14-15, 2023, Naples, Italy

Data was collected in two stages during the research procedure using ProQuest. The initial phase of the study was an examination of the overall number of records registered in ProQuest. Subsequently, this figure was refined to encompass the specific design disciplines falling within the study's defined parameters, namely area planning and development, urban planning, architecture, design, and interior design. Subsequently, the examination of place attachment revealed the identification of concepts pertaining to the environment, society, and the individual. During the second phase, the data underwent a secondary scanning process, wherein ten-year intervals were considered. The research pertaining to place attachment was then assessed based on their respective years of publication.

The initial investigation into the concept of place attachment was conducted throughout the 1970s, as observed in the initial scanning. In light of this rationale, the present study encompasses theses that have been authored on the subject of "place attachment" from the year 1970 forward.

3. FINDINGS and DISCUSSION

As a result of scanning the concept of "place attachment" in the ProQuest database (last updated: September 13, 2023), a total of 5657 results were found. The results obtained in the first stage of the research were narrowed down according to the fields of area planning and development, urban planning, architecture, design, and interior design to which this research is related, and 1071 results were reached. In line with the data obtained as a result of the scanning, Figure 1 shows the thesis production rates for the fields of "area planning and development" (312), "architecture" (366), "urban planning" (550), "design" (207), and "interior design" (21).

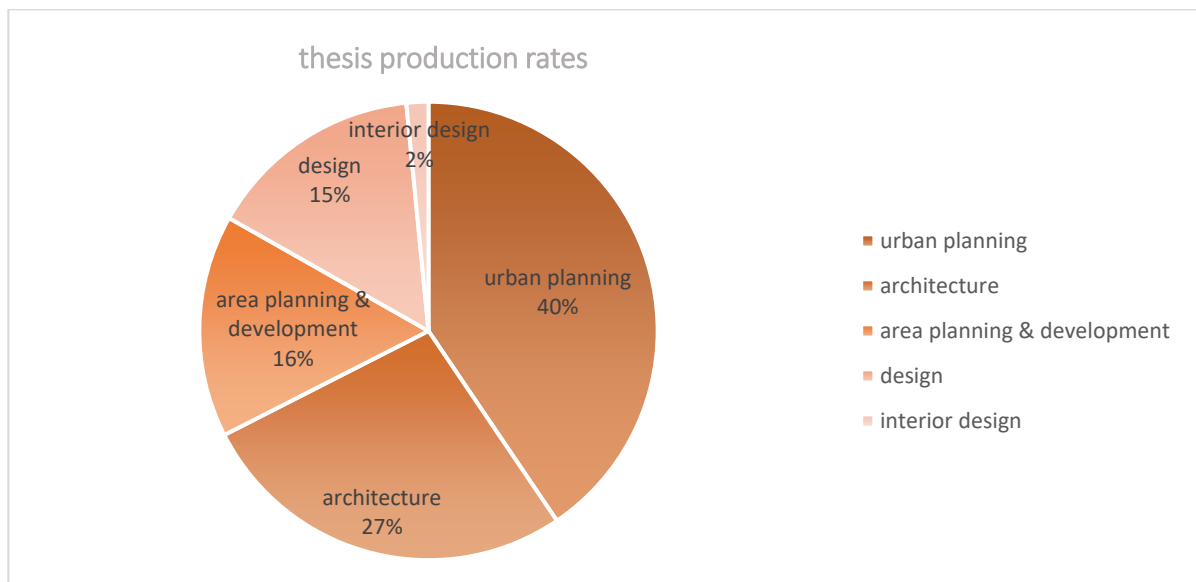

Figure 1. Thesis production rates by field in design disciplines.

When examining the broader scope of topics that theses in design disciplines have explored in relation to the concept of place attachment in regard to the environment, society, and the individual: cities, public spaces, housing, sustainability, climate change, green buildings, economics, culture, education, history, demography, aging, older people, communication, perceptions, privacy, identity, emotions, transportation, community, society, families and family life, and organizational behaviour issues are seen as predominant. When examining the

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

research topics, it has been seen that the overarching focus is the physical environment and the associated issues it encompasses. Sociological data pertaining to the overall dynamics of society is investigated, encompassing an examination of the individual and their emotional experiences. Based on the findings derived from this study, it is evident that the research issues under investigation are conducive to scholarly exploration across several domains, employing the framework of place attachment. It has been noted that every subject exhibits an interdisciplinary aspect, including multiple disciplines simultaneously.

During the second phase of the study, an exploration was conducted in the ProQuest database to investigate the concept of "place attachment" within ten-year intervals. Figure 2 illustrates the number of theses generated, encompassing both general and design disciplines, based on the data acquired through scanning. Based on the available data, it has been seen that research pertaining to place attachment experienced a notable rise during the 2000s, with the majority of studies conducted between 2010 and 2019.

Figure 2. Number of theses produced in general and design disciplines by year.

1970-1979: When the concept of "place attachment" was searched in the ProQuest database between 1970 and 1979, only two results were found. These studies cover psychology fields other than design disciplines. Upon examining the search results, it was observed that no instances of thesis work in the design disciplines throughout the 1970s were identified.

1980-1989: As a result of the screening between 1980 and 1989, 23 theses were found in all fields. The topics related to these 23 thesis studies were examined, and it was seen that there were three studies on the subject heading's "architecture" and "area planning and development" from the design disciplines. The first architectural thesis on the concept of place attachment was published in 1986 (Je, 1986), and the first planning thesis was published in 1987 (Al-Yousef, 1987). There was another thesis study on the intersection of architecture and gerontology in 1989 (Barrick, 1989). These three studies are considered important as they are the first studies in which the concept of place attachment is encountered in design disciplines.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

1990-1999: There was an increase in research focused on the concept of place attachment over the period spanning from 1990 to 1999. Based on the overall screening outcomes, a total of 200 theses were found. Due to the widespread availability of research findings, it has become feasible to categorize the data based on specific fields. The data obtained via scanning was refined based on certain subject categories, namely "area planning & development" (34), "architecture" (19), "urban planning" (9), "design" (2), and "interior design" (2). Consequently, a total of 49 theses have been reached (Figure 3).

Figure 3. Number of theses by field in design disciplines between 1990-1999.

2000-2009: It has been seen that the production of theses regarding the concept of place attachment continued to increase rapidly between 2000 and 2009. According to the general screening results between these years, 1021 theses were reached. The data obtained via scanning was refined based on certain subject categories, namely "area planning & development" (102), "architecture" (76), "urban planning" (74), "design" (14), "interior design" (11). Consequently, a total of 215 theses have been reached. Accordingly, the quantity of current thesis production has increased in design disciplines in parallel with the general trend (Figure 4).

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

Figure 4. Number of theses by field in design disciplines between 2000-2009.

2010-2019: It was observed that thesis production gained momentum between 2010 and 2019. In this direction, 3084 results were reached. The data obtained via scanning was refined based on certain subject categories, namely “area planning & development” (50), “architecture” (194), “urban planning” (324), “design” (125), “interior design” (7). Consequently, a total of 559 theses have been reached. It has been noted that between these years, there has been a notable increase in the number of thesis productions dedicated to the topic of place attachment, interdisciplinary interaction, and the level of thesis production was increased (Figure 5).

Figure 5. Number of theses by field in design disciplines between 2010-2019.

2020 - 2023 (September): It has been observed that a total of 1314 theses have been produced since 2020. The data obtained via scanning was refined based on certain subject categories,

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

namely “area planning & development” (25), “architecture” (75), “urban planning” (143), “design” (66), “interior design” (0). Consequently, a total of 248 theses have been reached (Figure 6). Based on the findings derived from the data collected in last three years, there is a projected anticipation of progressive and sustained growth in theses production that will persist until the culmination of the present decade.

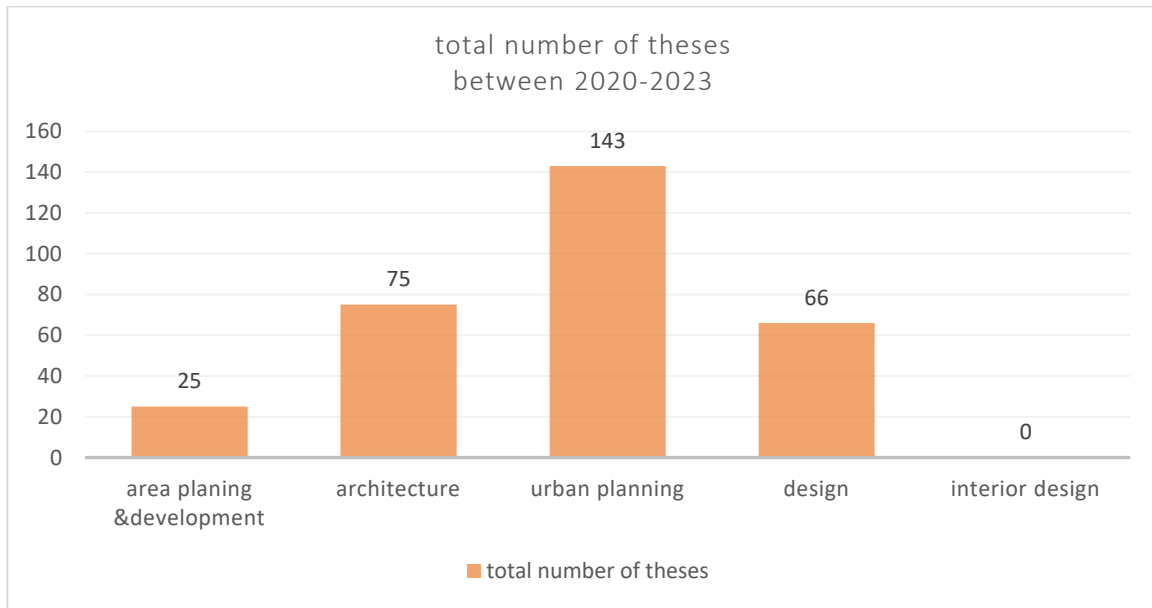

Figure 6. Number of theses by field in design disciplines between 2020-2023.

In light of all these evaluations, when we look at the density of theses produced on the concept of place attachment since the 1970s, it can be seen that there has been similar progress in the fields of architecture and planning. Looking at the decade-long intervals, interest in the concept of place attachment has gradually increased. It can be said that the simultaneous acceleration of production in all disciplines in 2010 and onwards is an indication that the interdisciplinary relationship has strengthened the concept. It has been concluded that, among the design disciplines, the field of interior architecture is the field where thesis production is least carried out.

This study has some limitations arising from the research environment. The first of these is that the ProQuest database is open to uploading data at any time; therefore, the numbers obtained may change every day. In this regard, it would be appropriate to state that the data collection process in the research was constantly updated between August 2023 and September 2023 (last edited: September 13, 2023). Another situation is that the subject limitation cannot be made according to a standard when narrowing down the results. The reason for this is that it is unclear which topics those who uploaded their thesis limited their topics to. While the number of theses is given in this section, the number of theses on which subject is stated in parentheses, but some studies cover more than one discipline. For this reason, the number of theses produced by the field does not match the total number obtained.

4. CONCLUSION and RECOMMENDATIONS

In this research, existing theses registered in the ProQuest database regarding the concept of place attachment were examined in order to guide new scientific research. A total of 5657

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

results were obtained covering the period between 1970 and 2023, and 1071 of them were found to belong to design and related disciplines. According to the research findings, the fact that most of these studies are in the field of “urban and regional planning” shows that the concept of place attachment has been mostly researched on large scales to date. “Architecture” is the discipline with the next highest production. In the field of “interior architecture”, thesis production is quite low compared to other design disciplines. In light of these data, it can be seen that the number of theses produced decreases as the scale of the research area decreases.

When we look at the literature, we see that the concepts of space, place, and place attachment are being researched even today in many different disciplines. With reference to this, it can be said that the development of thesis productions through interdisciplinary interaction can contribute positively. It would be beneficial for new scientific research to be conducted in this direction to cover a wide range from large scales (urban, environment, etc.) to smaller scales (interior spaces). At this point, issues related to the environment, society, and the individual, to which the concept of place attachment is more related, can be diversified, and the data obtained can be enriched. Diversifying the scales of research areas may enable the correlation of data in the literature from the urban scale to the spatial scale.

ABSTRACT

In the early 21st century, global awareness regarding non-renewable resource consumption, global warming, and climate change began to grow. The Paris Agreement prompted countries to create action plans, targeting global improvements in energy use and carbon emissions by 2050, with a focus on various sectors, including building construction. Buildings currently contribute around 35% to global energy consumption and carbon emissions, making it imperative to explore strategies for reduced consumption and emissions. Architects play a pivotal role in shaping building design and energy efficiency. Making informed decisions during the initial design phase is critical, and architects often employ simulation programs to predict a building's energy consumption. However, not all architects are proficient in these tools, and they can sometimes be limited in providing comprehensive solutions, prolonging the design and construction process. To bridge these gaps, the idea of offering architects literature-based support tools for decision-making has emerged. To this end, a literature review was conducted, focusing on energy-efficient decision-making methods in the early design stages. This study examined national and international master's and doctoral theses, aiming to enhance knowledge in this area and develop a roadmap for creating effective decision-making systems for energy-efficient building design.

Keywords: Energy-efficient Buildings Design, Early Design Phase, Decision-Making Methods.

1. INTRODUCTION

‘Energy’ is a fundamental concept in both physics and everyday life, its capacity to perform work being essential. It exists in numerous forms and is integral to many of our daily activities, including powering our homes, aiding in transportation, and enabling our bodies to function. Energy can be obtained from two different types of sources: renewable (e.g., solar, wind, hydroelectric, geothermal and biomass) and non-renewable (e.g., coal, oil, and natural gas, and nuclear). Renewable energy sources can be naturally renewed, and their environmental impact is minimal. They are sustainable and produce little or no greenhouse gas emissions. On the other hand, non-renewable energy sources are finite and deplete as they're used. They are associated with pollution and contribute to climate change (Energy Information Administration, 2023).

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

Issues regarding pollution, energy consumption and global warming began with the Industrial Revolution in about 1760, but officially came onto the agenda after the 1900s. The meetings at which energy issues were discussed are listed chronologically in Figure 1. The Paris Agreement signed in 2015, one of the most important milestones in the process that began with the UN Conference in Stockholm (1972), proposed to limit global warming to a maximum of 2°C. At the Intergovernmental Panel on Climate Change held after the Paris Agreement, it was decided that this limit should be reduced from 2°C to 1,5°C. In addition, reducing carbon emissions by 45% in 2030 compared to 2010 and zeroing carbon emissions in 2050 have been brought to the agenda. As a result, important strategies have been developed for many sectors such as agriculture, transport, industry, and construction. Ultimately, it has been emphasized that the use of fossil fuels should be reduced/eliminated, and the use of fully renewable resources should be started (International Energy Agency, 2021; Kabbej Sofia, 2017).

Meanwhile, the Energy Efficiency Law, which is the basis for most of the energy efficiency practices implemented in Türkiye today, has been published. The purpose of this law is to increase efficiency in the use of energy resources and use energy effectively, prevent its waste, reduce the burden of energy costs on the economy and protect the environment. Subsequently, the Regulation on Energy Performance in Buildings (published in 2008) regulates the procedures and principles for the effective and efficient use of energy and energy resources in buildings, the prevention of energy waste and the protection of the environment. With the signing of the Paris Agreement in Turkey in 2021, the Green Deal Action Plan was published, the Energy Performance Methodology in Buildings was updated in 2022 and the nearly-Zero Energy Buildings Guidebook was published (T.C. Çevre ve Şehircilik Bakanlığı, 2020; T.C. Ticaret Bakanlığı, 2021).

Figure 1. Chronological order of events related to energy efficiency and savings

Furthermore, the annual report issued by the Global Alliance for Buildings and Construction, an international voluntary organization endorsed by the UN Environment Programme in alignment with the Paris Agreement, serves as a comprehensive overview of the building construction industry's achievements in the preceding year. According to the report, the share

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

of building activities in global energy consumption has increased over the last 3 years to 35-36 and 34 percent respectively, while carbon emissions are 38-37-37 percent (as seen in Figure 2).

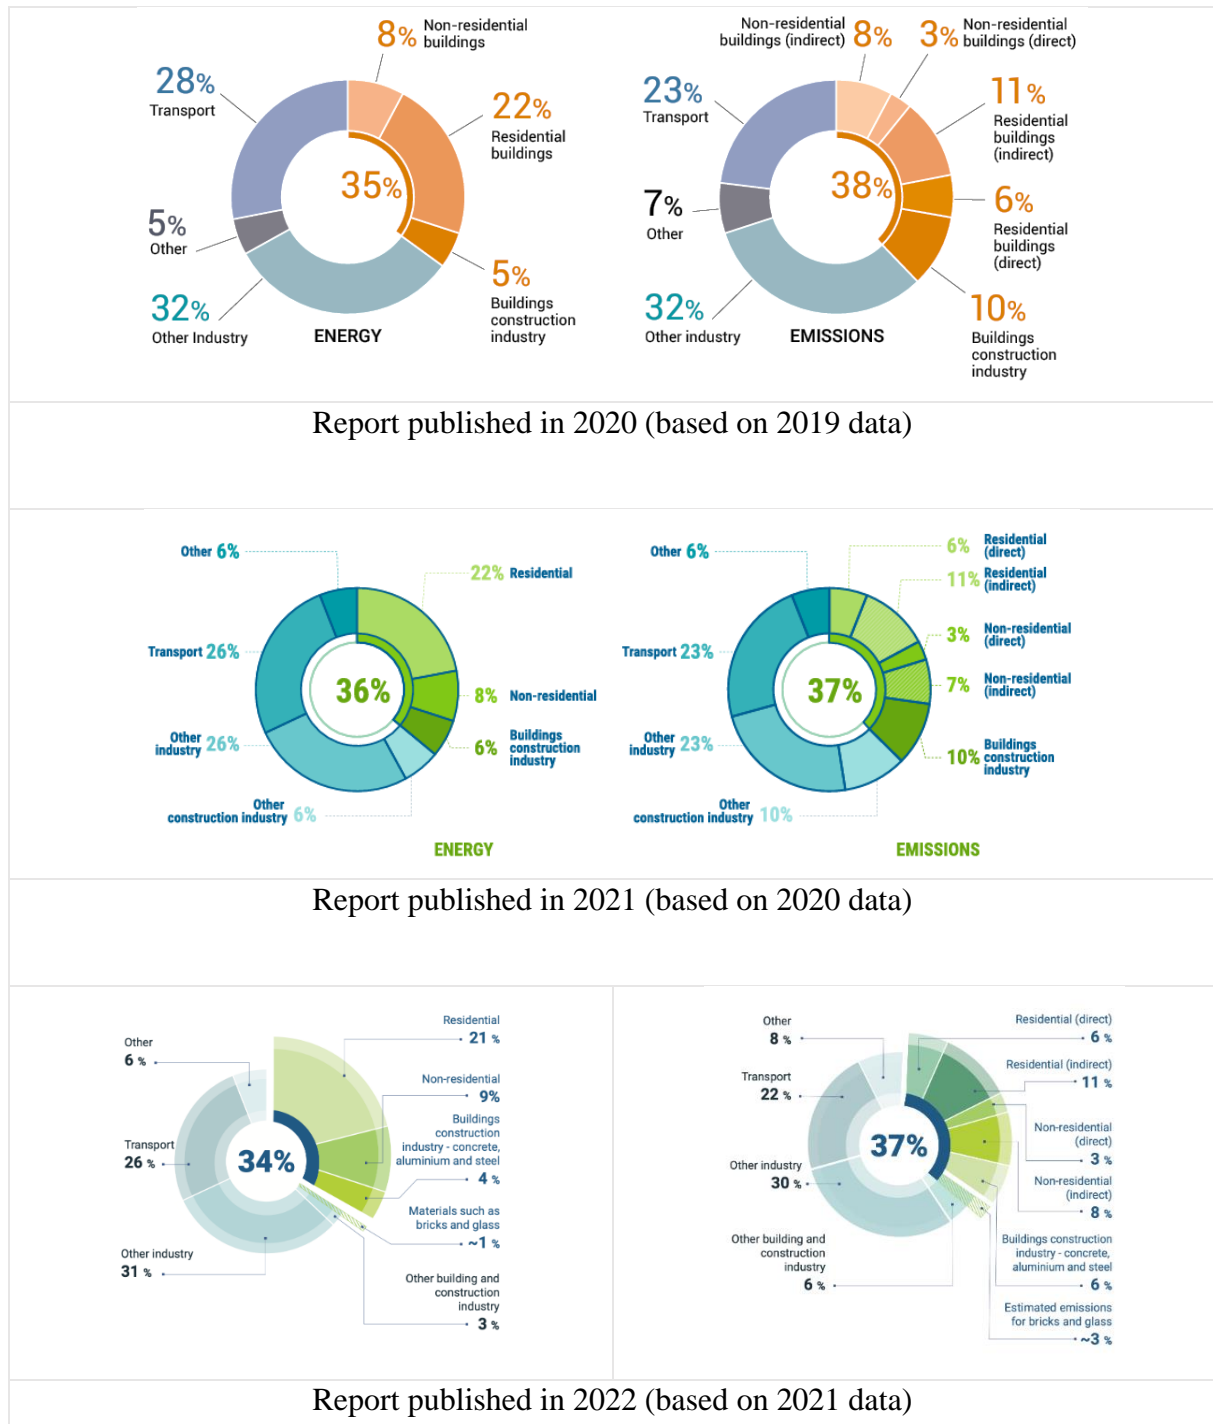

Figure 2. Share of buildings and construction activities in total global energy consumption (left) and share in total CO₂ emissions (right) (The Global Alliance for Buildings and Construction, 2022)

TeMALab

Department of Civil, Building and Environmental Engineering
University of Naples "Federico II"

III. International Architectural Sciences and Applications Symposium

September 14-15, 2023, Naples, Italy

In other words, construction activities have a significant 1/3 share of global energy consumption and carbon emissions. According to the 2022 report, the building and construction sector is not making sufficient progress towards the 2050 zero carbon target. Economic crises, energy vulnerabilities, security and climate crises are hampering the progress needed to increase resilience and decarbonize the global building sector (e.g., Covid-19 pandemic) (*The Global Alliance for Buildings and Construction*, 2022). Further progress is needed to ensure the global adoption of mandatory building energy codes and to move existing codes towards zero emissions. Governments are increasing their levels of investment in energy efficiency, in line with the levels required to meet the Paris Agreement targets. The global building industry must work with all stakeholders to decarbonize by 2050.

2. Energy Efficiency Regarding Architecture Discipline

Energy efficiency is the sustainable use of less energy to carry out a particular task and produce a desired outcome. It measures how effectively energy is utilized in a given process or system, with the aim of reducing energy wastage and curbing energy consumption, while simultaneously enhancing performance and output. Efforts to improve energy efficiency often include the development and deployment of energy-efficient technologies, the adoption of energy efficiency standards and regulations, and public awareness campaigns to encourage energy-saving behavior. Together, these measures contribute to a more sustainable and responsible use of energy resources.

a. Energy efficiency in buildings and its criteria

Energy efficiency in a building means minimizing the amount and cost of energy inputs for individual and social benefit, from birth to death (cradle to grave), including the design, construction, operation, maintenance-repair and demolition stages of the building. An energy efficient building provides thermal (climatic), visual and acoustic comfort conditions by providing maximum benefit from natural resources while consuming minimum energy (Dikmen, 2011). Accordingly, it is appropriate to consider the following criteria for an energy-efficient approach in buildings (Çevre ve Şehircilik Bakanlığı, 2011):

- Field (land) evaluations (*including site selection, building layout/orientation, creation of building geometry, making spatial organization and effective use of energy resources like renewable or conventional sources*)
- Building plan (*including compact layout, interiors, mechanical volumes, ventilation systems, configuration of building shell, windows and minimization of shading in winter*)
- Building energy performance calculation (*involving building purpose, local climate data, heated area and heated building volume, comfort conditions, building shell details, windows, exterior doors, ventilation rate and heat recovery efficiency*)
- Building Shell
- Ventilation Systems
- Mechanical Installation
- Construction-Quality Control and Certification

b. Decision-making in architecture

In this context, architects, and engineers, who are the stakeholders of building production activities, are the decision-making mechanisms in building design. Improving a building's energy performance and sustainability needs to start at the design stage, as the potential for optimization is greater in the early stages of a project and the impact of changes on building and construction costs is lower (Figure 3). Accordingly, making the right decisions at the early design stage to ensure energy efficiency in buildings can prevent problems that may occur later and is important in reducing energy consumption and carbon emissions (Bragança et al., 2014).

There are studies in the literature on the energy consumption of building elements and materials. With the information contained in these studies, architects and engineers can have an idea of the energy consumption of the structure they are designing by using various simulation/modeling programs during the design phase. However, because not all architects are skilled in the use of such software tools, and because these programs may lack the capacity for comprehensive decision making, or because of their potential to extend design and construction timescales, certain decisions are sometimes made hastily and based on traditional knowledge. As a result, as with the existing building stock, the energy efficiency of newly constructed buildings will not be achieved to the required level, which will delay the achievement of the Paris Agreement targets on a national and international scale.

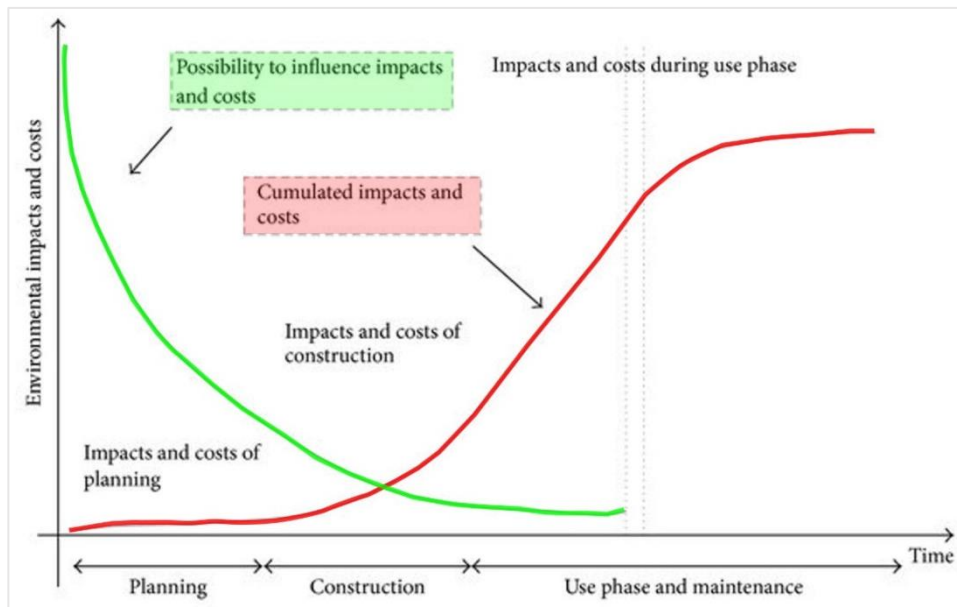

Figure 3. The relation between construction phase vs environmental impacts and costs (Bragança et al., 2014)

3. MATERIALS and METHODS

As explained above, the information in the literature on energy efficiency should be integrated into the design with a decision-making support tool at the early design stage. In this context, this study aims to investigate firstly the energy efficiency parameters in buildings and then the published master's and doctoral theses on tools that will help decision-making at the early design stage in the field of architecture. Thus, it aims to increase the level of knowledge on the subject.

III. International Architectural Sciences and Applications Symposium September 14-15, 2023, Naples, Italy

For this purpose, master's and doctoral theses were scanned using the ProQuest (international) and National Thesis Center (Turkey) databases under the keywords 'energy', 'energy-efficiency' and 'decision-making'. By examining the theses in their context of purpose, material, methodology, results, and suggestions, it is aimed to create a working model for a decision support model for energy efficiency at the early design stage in architecture. Two master's and three doctoral theses containing the words energy and decision in their titles were examined and are given in Table 1. Then, the aims, materials, methodologies, results and developed recommendations of these theses are given in Section 3.

4. FINDINGS and DISCUSSION

4.1. Review of existing literature

Bayraktar (2015) aimed to create an optimization algorithm that will enable the computational design of buildings that reduce CO₂ emissions during building use, ensure energy efficiency, and also address the consumption of HVAC systems and renewable energy technologies. The study was carried out on office type buildings for heating and cooling periods in the moderately humid Istanbul, semi-arid Ankara, and hot Antalya climates. First, parameters and data for energy efficiency were collected, and then simulations for energy efficiency were made using DesignBuilder and EnergyPlus (DB plug-in). Sensitivity analysis of the data was also performed using empirical methods and the results were optimized with MATLAB, GenOpt and modeFRONTIER. Using the proposed methodology can provide climate-appropriate design recommendations, which results in cost reductions and energy savings (Istanbul-moderate humid -energy 44%, CO₂ 49%, cost 21.7%; Ankara-semi-arid -energy 47.3%, CO₂ 50.4%, cost 23.3%; Antalya-hot humid -energy 57.5%, CO₂ 60.3%, cost 30.4%). Similarly, the thermal comfort of building occupants has been increased with new design suggestions. While

creating design alternatives, choosing products available on the market will make it easier if the system is used by architects/engineers working in the market. The design parameters examined were kept within the range allowed by the EnergyPlus program. Design parameters can be diversified with different parameters such as building form, shading element, construction area design. In this study, energy consumption was only considered in the usage phase (operational energy), while embodied energy was not taken into account. The study can be enhanced by adopting a cradle-to-grave approach. Optimization methods can be further refined (Bayraktar, 2015).

Gerçek (2019) aims to test the usability of a decision support process that analyses parameters related to heating, cooling, annual energy consumption, and carbon dioxide emissions during the early stages of residential building design. The study was carried out on residential buildings for heating and cooling periods in the hot humid İzmir climate. Gerçek identified key parameters by conducting sensitivity analysis with SimLab after collecting data. Energy-efficient alternatives were presented through energy simulation with DesignBuilder and EnergyPlus. Matlab, Microsoft Excel, and Autocad were utilized to assess the efficacy of the developed system through surveys and interviews. The study revealed that the parameters that most affect annual energy consumption and operational carbon emissions are the U value of windows and solar heat gain coefficient (SHGC). This tool, which helps experts involved in building production activities to use building performance simulation tools, has been shown to increase building quality at the early design stage. This tool has been shown to save time by reducing trial/error time. It is emphasized that the results obtained in the study can provide building professionals with greater awareness about the importance of a systematic design decision approach in the early design process and that it is possible to apply similar processes at different design stages and in various building types. Diversification of uncertainty and sensitivity analyses, increasing diversity by integrating building elements not included in simulation systems into the system, inclusion of embodied carbon calculations in future studies, and increasing the number of experts interviewed and the number of structures examined within the scope of the study are stated as aspects of the study that can be improved (Gerçek, 2016).

İşeri (2018) aimed to determine the importance of parameters to ensure energy efficiency in office buildings during the heating and cooling period at the early design stage in two different climate zones (Erzurum/Turkey - cold climate, Izmir/Turkey - hot and humid climate). After collecting data on energy efficiency, important parameters were determined with Python-Salib and Morris sensitivity analysis and energy efficient alternatives were presented with Design Builder and EnergyPlus energy simulation. As a result of the sensitivity analysis, it was revealed that the parameters of the building envelope (facade width, window-wall ratio, u-value of the roof) are more effective for Erzurum, which has a cold climate. It was observed that the results were similar in Izmir, which has a hot climate, but the distribution was more regular and the parameters related to solar gain also gained importance. In the study, evaluation of parameters for more than one climate type, the necessity of obtaining climate-related data from the most up-to-date sources, detailing the study of different building types, applying different sensitivity analyzes such as Monte Carlo to filter the parameters, and eliminating some deficiencies experienced while producing the energy model were stated as aspects to be improved (İşeri, 2018).

Ersan (2021) aimed to identify effective design strategies and develop a design support system that determines the impact levels of the identified strategies in order to reduce the increasing

cooling load in the hot period in the moderately humid Istanbul climate in high-rise buildings with transparent facades. After data collection and optimization, field studies, DesignBuilder and EnergyPlus simulations were carried out. The effect of many parameters on the cooling load, such as the average heat transmission coefficient of the window (u), Solar heat gain coefficient (SHGC), coolness index, sealing level of the window, climate, orientation, building form, glass selection and shading, has been discussed with a holistic approach. The lowest cooling energy requirement is the 17th scenario (6 mm low-e glass to the left in the outer glass, 12 mm argon gas in the 1st space, 6 mm flat glass (colorless) in the middle glass, 12 mm Argon gas in the 2nd space, 6 mm in the inner glass low-e glass + blinds) was recorded. In this scenario, the proposed passive cooling techniques provided maximum improvement in thermal comfort for the hot period. It has been proven that the decision support system presented in the study can provide accurate guidance to designers in their decision-making processes from the first design stage. It is a positive contribution that the developed system can be modified to meet other performance criteria. It has been stated that the study can be improved by detailing the study on different climate types and building functions, including passive strategies as well as active renewable energy technologies, and by providing guidance in the design of different building elements/components instead of transparent facades (Ersan, 2021).

Xu (2023) presented the inputs and outputs of a machine learning system covering two distinct areas: daylight illumination and pedestrian comfort analysis under windy conditions. To evaluate the effectiveness of these systems during the initial design phase, tests were conducted. Simulation and machine learning have been defined and the situations in which they are required have been determined. Data was entered with machine learning methods for various case studies and the results were evaluated. Software such as Rhino, Grasshopper, Climate Studio, HoneyBee, LadyBug, Eddy3D, Machine Learning models (ANN, cGAN), Phyton were used. Numerous techniques detailing individual simulation programs and machine learning models are featured in various literature. This dissertation offers a generalized, abstract roadmap for researchers to utilize in upcoming studies. The conducted case studies exemplify the incorporation of a framework for the development of physics-based simulation and machine learning integrated tools. As a weakness in the study, the machine learning model might not always create a reliable prediction. Even if this level of accuracy increases, there must be a human impact in the process (Xu, 2023).

In the five theses reviewed, a variety of system proposals were formulated for decision-making during the early design stages of buildings in different climate zones and heating periods. These proposals incorporated different methods and parameters along with various simulation programs and software. Furthermore, they were designed to accommodate diverse building types (Table 2). The majority of the theses explored both heating and cooling periods, with particular emphasis on office buildings. In certain theses, the chosen parameters were compared through sensitivity and uncertainty analyses with the assistance of programs like SimLAB, Grasshopper, and Python-Salib. The majority of theses utilized a range of simulation and optimization programs, with DesignBuilder and EnergyPlus simulation program plug-in and Rhinoceros Grasshopper parametric modeling and analysis programs being the most commonly used. In addition, it has been observed that certain building physics parameters can be assessed utilizing machine learning (ANN, cGAN) along with simulation software.

The parameters, building types, and climate types examined in most theses are typically limited. Moreover, the studies fail to account for embodied energy consumption, and the proposed

III. International Architectural Sciences and Applications Symposium
 September 14-15, 2023, Naples, Italy

systems are not adequately visualized and presented in a user-friendly database. Additionally, the studies often exclude parameters related to renewable energy consumption. Diversifying sensitivity and uncertainty analyses in these studies is also possible. There is also potential for employing artificial intelligence and machine learning technology in a system designed to assess parameters of energy efficiency.

4.2. Energy Efficient Decision-Making Support Model Proposal

According to the theses examined, a decision support model that can support architects and engineers who play the decision-making role in building construction activities, which have a significant share in energy consumption, in making energy efficient design decisions to benefit on a global scale in preventing climate change and reducing global warming, can be produced with the organization diagram given above in Figure 4. The studies to be carried out in this context are aimed to provide added value in solving energy-related problems.

5. CONCLUSION and RECOMMENDATIONS

This study focuses on the efficient use of energy, which is an indispensable part of our daily lives and is necessary to perform all vital activities. In this context, buildings and building construction activities, which are responsible for 1/3 of global energy consumption, need to be made energy efficient. The Paris Agreement targets signed in 2015 also support this situation.

Architects and engineers, who play a decision-making role in building production activities, need to combine the information about energy efficiency in the literature with various simulation programs and make holistic decisions.

In order to produce a decision support tool that can help with this, theses written on this subject have been examined and presented in Section 3. The aims, materials, methodologies, results and suggestions of the theses examined were revealed and the missing aspects in the literature were stated. As a result, it is thought that a model can be produced with the decision support tool organization chart presented in Figure 4. It is aimed that this study will provide a basis for future studies.
